Look for a book called The Art of Electronics. I don't recall the
author, but I have it in storage and will be unpacking it in about a
week, but a good bookstore should be able to look it up.

Also, an older ARRL Manual is good, early 1980's. I find that I don't
like the newer ones as much.

Try calling a local Technical School like DeVry or ITT Tech and see what
they use to teach with.

Good luck

A very nice little 300 or 500W class E amp in May 97 QST using a single
transistor and requiring about 3W drive. Not linear at all, but should be
great for CW or FSK. Extremely small and simple. I suspect that the power
supply is a bit tricky for this type of amp. That is covered in the JUNE issue
which sadly I do not have. I bet you could get a KW out of this little fellow
on CW with a robust cooling fan. Looks like an under $50 project (the IRFP440
transistor for the 500W version costs $11)... lots of bang for the buck. Very
compact too... about the size of the last reciever I built. I might try this
one myself when I get hold of the follow-on articles.

I sure would like a copy of the next article of the series if anybody has it. I
am a life member, but my QST delivery was severely disrupted last year and I
seem to be missing June and July.

Run out and get the ARRL book "solid state design for the radio
amateur".

What others tell me:

Hello Burt,
It is rather tragic to see the juvinile garbage coming from the USA in many area of Internet, including the amateur sections. Reading the comments from various so-called amateurs on the amateur newsnet leaves oh so much to be desired. The garbage is all and only from the US. I just picked out you by chance to reply. I would like to inform you and all your tunnel-vision US amateurs that a greater percentage of "hams" around the world work "barefoot" - 100 watts and quite often with not much more than a dipole and/or long wire.

...Calling CQ-DX is quite common on all international HF bands. It is quite possible because of all the drivel eminating on the "ham" bands in the US, you may rarely get to hear the rest of the international amateur fraternity. Perhaps - and I would be surprised if what I am to say were not true - too many American Amateurs treat the radio hobby as CBers treat and violate the CB bands....!

It is indeed unfortunate in that too many of your compatriots fail to grasp the fact that the whole world sees (Internet) and hears (amateur radio) so much drivel originating from the USA. While there are many good and highly skilled amateurs in the US, there would appear to be a majority who are nothing much better than the worst type of CB operator. During the Second World war there was a well known saying...."When the British were bombing the Germans ducked for cover. When the Americans bombed everyone but the Germans ducked." It would seem that saying still applies today. When US operators are on the Net the rest of the world turns off. And when you are on the Amateur Bands.....! Need I say more! You have my full permission to insert all my comments on the BBS Nets used by yourself and other US amateurs.

Regards, GARRY (ZL2JW) Net address: Winthrop_G@Kosmos.wcc.govt.nz

5204. Off topic posts

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-23 00:00:00 UTC

I have received a number of personal Email complaints about off topic posts. I must admit the posters had a point. No matter how important I think not owning a gun is, it may not belong in any of the above newsgroups. I will endeavor to post only messages with a ham radio theme and that theme will be related to the conference I am posting in. Thus I doubt you will see any more posts in any group but misc. Is that better? People have a right not to deal in weighty issues if they want to get away from it all. They could be called off topic but they were not SPAMS.

Comments?

Burt

Any Moron stupid enough to own a Mac , should get software that sucks , It
your own stupidity to even go out and buy such a machine most software
manufacturers are pulling away from Mac because they are a dying machine.
get a life and buy a real computer !!!

Just a note about problems with IBM machines . Corel does work on them !!!
there maybe bugs in it but I haven't found any yet and I use it every day
ver 5 , 6, 7, and 8.0

Before you shout FRAUD THINK ABOUT SLANDER SUITS THAT CAN ARRISE AGAINST YOU
!!!

This fellow's spots may not have changed yet...he sent a letter to the
Editor of RADIO WORLD Magazine (Radio Broadcasting Mag)
that totally denigates hams, and amateur radio. Putting junk on usenet
forums is one thing, but letters to the editor of professional mags that
are seen by the FCC and those wishing to get our freqs, are quite
another.

Source record: 82683

After a 8 year hiatus, I'm getting interested in ham again, decided to build my own little transceiver, and subscribed to this group to see what's up. And I can see; more political bullshit. I'm sorry for the epidemic of children killing others, in school, on the streets of Watts or Harlem, or anywhere in the world. What connection that has to ham radio I don't know, don't see the connection, don't understand why that was the first thing I saw when I checked out this group. As far as hams needing guns for "guts", that is one of the most idiotic statements I've seen in a long time; so a whole group of people is condemned because some hams have guns??????? I favor private gun ownership; But I do not own, nor do I intend to own, a gun. And I think that the person who decided to condemn us all owes the hams of America a big apology.Thanks for your time.....Dave KA3HGN

I recently bought a 6m amp using 2 4cx350's.
I have 2 problems.
1> I only have 1 coax relay, and looked in the catalog and WHEW....
anyone got surplus?
2> on a digital bird meter, <we didn't have the correct slugs> with
100-250mhz slugs I get 456 watts out with OLD tubes. does this
sound wrong? I know that the wrong slugs will show low <or high>
wattage, what is this setup capable of doing?

my xformer does 2200 v .75 a continuous, and 1.1a icas.
4cx350 <jan8321 tubes> <2ea>
seems to run pretty clean, a dipole at 50 ft did no tvi at
175 yards to channel 3 and 4.
thanks in advance for any/all advice info...

btw I need one more coax relay....but how to wire it???

Genie

A man found a bottle and was dusting it off when a genie appeared. The genie said, "I will grant you only one wish, what will it be?" After thinking a moment the man said, "Well, I have plenty of money, a nice house and a wonderful family, but there is one thing I would like to have: a vacation. I know, I would like to go to Hawaii, but I don't like to fly, and boats make me sick. What I want you to do is to build a bridge from California to Hawaii so that any time I want to go there I can drive." The genie replied, "WOW, do you realize what a tremendous request that is? That is over a thousand miles and across probably the deepest part of the Pacific ocean. Can you comprehend how much steel and concrete that would take? That would be a tremendous undertaking. Are you sure there isn't something else you would like to wish?" The man thought for a minute and said, "Yes. Please explain hams to me. They are so boring, they repeat things, they never show any guts and they hide behind their mikes. How can anybody have a life like that? The genie replies
"Will that be 4 or 6 lanes."

5221. am modulation via xtransormer

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-23 00:00:00 UTC
From: Tim Hynde <hynde@flash.net>
Message-ID: <3566E76B.341BEFEA@flash.net>
Source record: 82694

In the old VHF handbook, the one that sold for $4 back in the 70's there is a plan for a 6m AM transceiver using an AM radio as the IF and audio section.

The transmitter is a simple fundamental xtal and in the final (about 1 watt) there is a center tapped transformer, the center tap goes to the secondary of an audio transformer. The primary is 8 ohms (I suspect so that you could drive it from an off the shelf audio amp) and the secondary is 50 ohms. Since I've had a hard time finding one rated at more than 200mw or so I wonder if you could not use a different impedance on the secondary lets say 1k ohm vs 50 and then make the appropriate changes in output transformer of the final transistor.

OR - I've seen other designs that are transformer less in the audio stage and just use a transistor driven by audio then connected to the center tap of the transformer in the final output stage. Can someone shed some light on this? I want to build one for 6m am but wonder what the options are for modulating it.

Tim

I like that Burt. I think it is funny, however I have been a Ham for over 25 yrs and very much enjoy talking to people all over the world. I don't think you can explain Hams anymore that you can explain life. There are too many aspects of the hobby to narrow it down to one simple answer.
I do enjoy most of your responses to other folks (most don't realize that they are the one being had).

David - W4DSM

You've clearly stated the problem. However, you failed to state the
cause.

Burt won't go somewhere else, even with all the ridicule that's been
heaped on him. He, by some perverted reasoning, thinks that he's not
only right but that he can also post off topic at will.

Now for the cure: Filter Burts posts.

Can we just drop all this crap. Guns are not responsible for deaths, it is the PERSON WHO PULLS THE TRIGGER. Just about all of the guns used to commit crime were stolen/untraceable, They are not legally owned. If you feel that this is not the case you are a total IDIOT. Read the facts of the cases not what the "news media" hypes. You will find the truth, not what they want you to see.

5229. Internet Elmers Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-23 00:00:00 UTC
From: pschleck@novia.net
Message-ID: <CeD91.1830$t4.1592779@newscene.newscene.com>
Source record: 82702
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Based on data reduction and analysis of an ongoing log of actual compound subject/geographic queries of the Amateur Radio Elmers Resource Directory:

http://www.novia.net/~pschleck/elmers/

I've concluded that there is a need for Elmers in the following three categories:

- Elmers in geographic areas that do not appear at all in the Directory

The following U.S. States/Commonwealths/Districts/Populated Territories, Canadian Provinces/Territories, and those Countries representing the top-10 countries in licensed amateur population (based on IARU statistics), do not have any Elmers at all in my Directory:

American Samoa
District of Columbia
Guam
Iowa
Montana
Nevada
New Mexico
North Dakota
Puerto Rico
South Dakota
Virgin Islands
Wyoming

Manitoba
New Brunswick
Newfoundland
Northwest Territories
Novia Scotia
Nunavut (beginning in 1999, currently part of Northwest Territories)
Prince Edward Island
Quebec
Saskatchewan
Yukon Territory

INDONESIA (listed here for completeness; considering the political situation, I don't expect to recruit many Elmers from this country in the near future)
JAPAN

THAILAND

- Elmers in specific, frequently-requested, subject/geographic category pairs that do not appear at all in the Directory (at least at the time the requests were made; they might currently appear in the Directory, based on recent updates)

The following are the most needed subject/geographic category pair Elmers that did not appear at all in the Directory, based on an arbitrary "No match" query threshold of 3 or more. They are ordered alphabetically by geographic area, then by need. The number in parentheses represents the number of requests for such an Elmer since the compound subject/geographic query was added around mid-1997.

Please note that this message is only recruiting Elmers that match the above criteria, and only via the on-line WWW registration form, at this time. Other Elmers are always welcome, but are requested to wait a month or two before registering to limit the workload on me this month.

If you meet the criteria for any of the above categories, and wish to volunteer as an Elmer, please go to the following on-line registration form:

http://www.novia.net/~pschleck/elmers/register.html

Questions (only) to my E-mail address below.

Curtis .. N5HDQ .. http://wf.quik.com/n5hdq
I can't think of anything witty to say here.
Oh well, no one is perfect.

What do you know about what is scheduled to happen
in November as regards the Brady Law?

Do you remember that back in 93 when it was being
debated it was presented as a 5 year Law that would
prevent handguns from falling into the hands of
Criminals and fade into the sunset in 98 ...???

Not so. It was in the original language that five
years after enactment that the word handgun be
replaced with firearm, and an instant background
check be conducted for the purchase of a FIREARM.

It seems that the law has been modified by various
agencies (is this legal in itself) to the point
that a National Firearm registration program will
be attempted. This does not pertain to new guns
alone as if you take in a gun for repair a background
check is supposed to be ran on you.

How do you feel about a law that was ruled, at least
in part, as un-constitutional being beefed up to suit
Clinton and his gun grabbing Corps..?

There is a bill (H.R. 2721) going around on Capitol
Hill now that would kill Brady cxompletely should it
become law. It needs help now as there are only four
signed on to it now.

If you want to help you could contact your people
in Washington urging them to sponsor H.R. 2721.

5231. 9600 bps mods for Hamtronics T301 exciter

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-23 00:00:00 UTC
From: gaitherc@smart.net
Message-ID: <6k73ig$f3e$1@news.smart.net>
Source record: 82704

Does anyone know what mods need to be made to the audio filter of the Hamtronics T301 exciter to make it work at 9600 bps? The board I've got appears to work only at 2400 bps and below.

Thanks in advance and 73.

Peter Young, K3IN

I have some pcs of this excellent valve. This is in fact a real GEC
KT 88 inside the bulb, but with a top cap and 12.6V 0.8A heater. This
valve can stand 1250V on the anode.
NOS, but in white boxes. They were spare valves for a transmitter.
These are very scare and expensive. You will have to pay at least
£ 40.- for used, tested ones in UK. Or about US$ 65.- each.
My price is US$ 70.- each for new, unused.
E-mail me for details.

Best regards,

Arnold Goks£yr

CALL FOR VOTES: nl.binaries.radio.amateur.schema

Dit is een oproep om te stemmen over het aanmaken van de newsgroup

Verspreiding van deze CFV of delen hiervan is aan beperkingen gebonden.
Deze beperkingen gelden tijdens de hieronder aangegeven CFV-periode.
- Delen van deze CFV mogen niet op enige wijze verspreid worden.
- De gehele CFV mag niet zonder toestemming van het NL-Stembureau
verspreid worden.
- De beheerder van een in de CFV genoemde maillijst is gerechtigd de
CFV naar de genoemde maillijst door te sturen. Dit geldt alleen als
de betreffende beheerder van het NL-stembureau een PGP-signed
exemplaar van de CFV heeft ontvangen.
- Het is toegestaan zogenaamde pointers of verwijzingen naar de CFV
te verspreiden. Deze verwijzingen dienen neutraal te zijn.

Deze CFV wordt gepost in de nieuwsgroepen:
nl.announce
nl.newsgroups
nl.radio.amateur
nl.radio.scanners
rec.radio.amateur.homebrew
rec.radio.amateur.equiment

De voorsteller van de groep is:
Adriaan PE1KHP pe1khp@wxs.nl

In de RFD gepost op maandag 13 april 1998 met ID RFD
nl.radio.amateur.schema
zijn velen bezwaren gevonden, maar ook velen die positief reageerden.
Het is meer de vraag of we nu binaries nieuwsgroepen moeten to laten.
Daarom nu de CFV.

Naam: nl.binaries.radio.amateur.schema

Voor het posten van vragen over schema's van zend-ontvangers, scanners,
meetapparatuur, antenne's en electronica onderdelen. Dit met toegevoegde
schema of tekening in gif formaat zwart-wit.

Charter: Binarygroep m.b.t. onderwerpen aangaande radiozendamateur
schema's, die niet gepost kunnen worden in nl.radio.amateur.

STEMFORMULIER

Er kan gestemd worden vanaf zondag 24 mei tot en met
zaterdag 14 juni. Het stembureau zal dus 3 weken geopend zijn.

Er kan op de volgende manier gestemd worden:
Stuur een mailtje naar nl-stem@polyware.nl, met in het subject
minstens nl.binaries.radio.amateur.schema en in de body van het bericht
1
(en niet meer) van de volgende regels:

- Ik stem VOOR nl.binaries.radio.amateur.schema
- Ik stem TEGEN nl.binaries.radio.amateur.schema
- Ik ANNULEER mijn stem inzake nl.binaries.radio.amateur.schema
- Ik stem BLANCO nl.binaries.radio.amateur.schema

Dit kan het eenvoudigste gebeuren door een reply te geven op dit
artikel en alles behalve de gewenste regel te verwijderen.

Binnen enkele dagen na inzending van uw stem ontvangt u een ACK van
het NL stembureau. Indien u die niet ontvangt, kan er iets mis zijn
met uw afzenderadres of uw mailtje is niet aangekomen op het NL
stembureau. In beide gevallen kunt u, na controle van uw e-mail-
instellingen, nogmaals uw stem uitbrengen. De laatst uitgebrachte
stem zal te allen tijde geldig zijn.

De stemming is openbaar. Tussentijds worden lijsten gepubliceerd van de
ontvangen stemformulieren. Deze lijsten bevatten alleen het e-mailadres
en eventueel de naam van de stemmer. In de lijst die na afloop van de
CFV wordt gepost, wordt tevens vermeld wat iedereen gestemd heeft.

Deze CFV is gepost door het NL-stembureau namens de voorsteller van de
groep.

5237. 1964-era transceiver (2 tubes) you can build!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-24 00:00:00 UTC
From: bry@mnsinc.com
Message-ID: <356791c3.15960710@news.mnsinc.com>
Source record: 82618
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Well folks at long last it is almost ready, and you can get a SNEAK PREVIEW this weekend if you like!

This little transceiver project is a very thorough presentation with several pages of text and graphics.

As a 13 year-old boy I was introduced to the joys of radio by various friends. Back in those days there was a cool magazine on the news stands in Britain, called Practical Wireless.

I devoured every issue that I could get my hands on, spending hours poring over the advertisements etc.

I think the June 1964 issue was the first one I ever saw, and I was fascinated by the thing! Here I present a copy of the article showing how to make a portable tube transmitter (10 watts) and regen receiver, that ises a total of TWO TUBES!

I hope some of you may actually have the joy of building this tiny station that is small enough to fit, "IN AN OVERCOAT POCKET" and yet capable of working the world on 7 Mc/s.

If anyone wants any explanations on the strange terminology or symbols used, they are welcome to e-mail me!

The money symbols refer to the OLD British money system using:

5/- to indicate five shillings
2/- indicates 2 shillings.

The magazine was abit phoney in that they gave the "blueprint" with the magazine at no charge, and it was obviously printed ONLY to accompany the magazine, and yet they printed a PRICE on the blueprint to try to make you feel that they were doing you a big favour by giving you something extra for free!!

I have some 6GW8 (ECL80) tubes here, and I may try to reproduce this little rig myself, even though I am not particularly fond of regen receivers (grin - sorry!)

Everyone please take a look and enjoy the article. I will be adding a couple more pictures and improving the layout. Most of the pictures enlarge if you click on them.

> In de RFD gepost op maandag 13 april 1998 met ID RFD
> nl.radio.amateur.schema
> zijn velen bezwaren gevonden, maar ook velen die positief reageerden.
> Het is meer de vraag of we nu binaries nieuwsgroepen moeten to laten.
> Daarom nu de CFV.

Er is dus nooit een RFD geweest voor nl.binaries.radio.amateur.schema
onder die naam? (Die kan ik ook niet vinden in Deja News, en als
vaste lezeres van nl.newsgroups kan ik me die ook niet herinneren.)

Ik vind dit een onjuiste gang van zaken. Je kunt best ter CFV gaan met
wat kleine aanpassingen ten opzichte van de laatste RFD. Echter, er is
internationaal consensus dat een wijziging van nieuwsgroepnaam een
nieuwe RFD vereist. In het geval van een zï¿½ belangrijke naamkwestie als
het instellen van een nl.binaries.* subhiï¿½rarchie, waar in tegenstelling
van nl.* binary's toegestaan zijn, vind ik het passeren van een
(volgende) RFD hiervoor een ernstige nalatigheid.

I bought a Microwave Moudles LTd MMT432/28 transverter at Dayton this year. I got a small about of documentation with it. I am looking for more information about it.

1. Was this a kit or an assembled transverter when they were being sold?
2. Does anyone have any information on them?
3. Did anyone buy them out and start making them under another name?

Any assistance with this would be apprecitaed. Thanks in advance for any help that you can be.

NTE has a cross-ref at their site, can't remember url but should be easy
to find. They also have software to download.

Hi Jeff,

Check out "www.nteinc.com/index.html". Their NTE semiconductor numbers
are direct crossovers to ECG numbers. Hope this helps.

Mike

Hello to all,

Could somebody please answer a question for me please:

Supposing I had a radio with no volume control - the audio signal just went straight to the speaker so it was at full volume all the time. How do I work out the proper value of variable resistor if I wanted to add one?

Many thanks and regards to all.

Terry Gaff

MM went out of business a few years ago, and was subsequently re-
incarnated. I don't think that they made kits.

It was factory-assembled.

>2. Does anyone have any information on them?

There never was much more than a small amount of information witht he
original transverter. There are some schematics and mods available
(though I don't have details - sorry).

You might try asking again on the specialist vhf reflector. To
subscribe, send a message to majordomo@w6yx.stanford.edu with no subject
line and the body-text saying only

>
The original MM company had expanded way beyond amateur radio, but went
under when a big order for Kuwait was suddenly canceled by Mr Saddam.
The professional operation re-started almost immediately but the amateur
side was not revived until the last 2-3 years, as a completely separate
outfit. Unfortunately the new MM failed to take off, but is still
operating.

There's no point in contacting the new MM because they have never been
involved with old products such as MMT432/28. That design is now at
least 20 years behind the leading edge.

The audio *usually* goes straight from the audio amp to the speaker.

To control the volume, you control the amount of signal fed to the amp,
or you control the gain of the amp.

What is a suitable potentiometer will depend on the characteristics of
the amp and of the amp or filter that is feeding it.

Yeh, you can easily swing most crystals a couple of kHz. I was able to shift a 7.120 MHz crystal about 5 kHz higher and about 3 kHz lower than nominal freq. Just put a coil, about 10 turns of #18 magnet wire wound over a 16 penny nail (remove the nail... it is only a winding form) and about a 60 pf variable capacitor in series with the crystal. More inductance and capacitance allows bigger swings, but eventually you reach a point where the oscillator loses its stability. Experiment with different coil/capacitor combinations and crystals. Don't be surprised if you only are able to shift the frequency a kHz or so either way, especially at lower frequencies. This is one possible application of a varactor. Note that the amount of inductance or capacitance for a certain amount of swing depend on the crystal's characteristics and the circuit the crystal is in. The cut-and-try method should work for you, though.

Yea but more details would help. Xtal controlled for what HF? 2m HT?
If it's HF a VFO can easily be built for any of the bands to replace the Xtal.

A crystal looks like a high-Q series-resonant circuit. With this in mind, I replaced the xtal in a Clapp oscillator (very similar to Colpitts) with series LC arrangement. Worked like a dream! I've used both mechanical variable caps and varactors in this configuration. Inductors were toroids wound on Amidon cores. Stability is not as good as a rock, but it's worth a try.

The circuit I used it in was a Clapp using a half a 12AT7 as oscillator, the other half as a buffer, part of a piece of British avionics equipment.

> the amp and of the amp or filter that is feeding it.
>
> 73
>
> Rich W2RG

As Rich says, the simplest way too control volume is to control the amount of signal into the audio amplifier with a suitable potentiometer. In practice, the resistance of a potentiometer at the input of the amplifier is high; tens of thousands to hundreds of thousands of ohms. The signal voltage at the input of the audio amplifier is typically small. As a result, the amount of signal power dissipated in the potentiometer is usually negligible.

In contrast, if you MUST for some reason control volume at the output of the amplifier, you will end up dissipating considerable power. You have three choices. 1. use a two-terminal variable resistor (sometimes called a reostat). This includes connecting one end and the arm of a potentiometer. In a 4-ohm speaker circuit, you would need 50 or 60 ohms to reduce the volume a lot. This kind of connection cannot reduce the volume to zero. 2. connect the ends of a potentiometer across the output of the amp, then connect the speaker between one end and the

arm. This works, but really dissipates a lot of power. There is a tradeoff between resistance on one hand and linearity of the control action and amount of power wasted on the other. If you had audio power to burn and could drive a 0.4 ohm pot, linearity (rotation vs volume) would be good, but you would waste 10 watts in the pot for every 1 watt of output from the speaker. If you instead use a 40-ohm pot, you will save power, but the linearity will be very bad - all the control action will be at one end. 3. you can buy a special control just for this purpose. It's a speaker level "L" pad, but it's relatively expensive. Controlling audio level at the output is just a bad choice. Hope this helps.

Neither do the first, third, fourth. . .amendments.

In the first amendment, the right of the "people" to peacabley assemble applies to individuals and limits the power of any level of government. If the "people" are a collective such as the state, no one can assemble unless they are members of the national guard or other state sanctioned function.

Also, in the fourth amendment, the right of the "people" to be secure from unreasonable searches and seizures is an assertion of individual rights and a limit of all levels of government. Same for the other amendments comprising the bill of rights.

In the second amendment, the right of the "people" to keep and bear arms are an exception???? a collective right??? Think!

A state cannot have a RIGHT. States only have AUTHORITY granted to them by consent of the PEOPLE who have RIGHTs.

Read the federalist papers. They explain it all.

From: Bob Lewis <aa4pb@erols.com>
Message-ID: <35696689.39A5507E@erols.com>
Source record: 82561

I just installed an HTX-242 in my Mazda PU (i.e. Ford Ranger). I powered it from the accessory line at the fuse block. If the broadcast radio is on and the HTX is off, the radio continues to run for about 4 minutes after I take the key out of the ignition. If I hit the power button on the HTX then the radio goes off immediatly.

It turns out that the HTX has two 1200 mfd capacitors (part of a pi filter) ahead of its on/off switch (which is solid state). The broadcast radio is powered from a constant 12 volts but has a "sense" input connected to the accessory line to control switching. The capacitors in the HTX hold the accessory line up and keep the radio turned on until they discharge. The Mazda must not have any low impedance loads on it's accessory line that would discharge the caps. Interesting!

My solution was to power the HTX directly from the battery and give up control from the ignition. I thought about using a relay but am concerned about the contact life because of charging those capacitors each time you turn the ignition on.

Cars deaths are accidental. I don't remember hearing of a kid steering a car into a crowd of students. You have no point. Shooting someone with intent to kill is not an accident. Kids grow up with a fasination of guns. TV, the news, and gun lovin' parents are likely at fault. The NRA say's that education is the key. Gosh I think these kids already know how to shoot.

Enough said, our society has no real use for guns regardless what you say. They kill, thats what they were made to do and thats what they're being used for.

5284. FS: Weston Panel Meters

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-25 00:00:00 UTC
From: Al Dolgosh <al.dolgosh@hamradio.org>
Message-ID: <3569A984.6C2F@hamradio.org>
Source record: 82569
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap

For Sale:

Matched set of two new panel meters - ideal for the homebrew builder.
These are high quality Weston meters I got for a project I never built.

0-50 ma DC
0-200 ma DC

These modern panel meters are rectangular - 3-1/2" wide by 3" high - and
can be mounted in a 2-3/4" round meter hole. Additionally, each meter
has an optional Weston escutcheon kit, which allows it to be mounted in
a 3-5/8" by 2-1/8" rectangular hole.

I will sell for $20.00 ea plus shipping from 44134.

Go to your yellow pages. Look for a replating outfit. They normally do replating of "silver" ware. If you do not find one there, ask a jeweler to point you to one.

I'll second Kevin's idea. Even though I can't believe that this type of
tragedy would happen, I wouldn't wish it on anybody...not even Butt...I
mean Burt. My best friend was shot and killed in a drive-by shooting two
years ago. I will NEVER forget the moment when I was told what had
happened. Maybe this isn't the right place to talk about this, but maybe
Butt...I mean Burt, should get a life, and realize that this COULD actually
happen to him. What would he say then?? Would he still ridicule the
world??? I'm not saying I'd want it to happen to him, but maybe he needs
to clean the pre-mordial ooze out of his eyes and his one brain cell and
take a look @ the world.

Message-ID: <3569C62C.49EB@hamradio.org>
Source record: 82577
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap

For Sale:

Matched set of four matched new panel meters - ideal for the homebrew builder. These are high quality LFE/API taut band meters I got for an amplifier project I never built.

(Filament) 0-10 volts AC
(Control Grid) 0-50 ma DC
(Screen Grid) 0-100 ma DC
(High Voltage) 0-8 Kilovolts DC (1 ma movement - requires 8 megohm multiplier)

They are not marked with "Filament", etc. - this is what I intended to use them for. I never got a plate current meter.

These panel meters are modern rectangular - 2-3/4" wide by 2-3/8" high - and mount in a 2-1/8" to 2-1/4" round meter hole.

I would like to sell only as a set. Best offer over $60.00 plus shipping from 44134.

5295. Crystal filters for upconversion reciever

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-25 00:00:00 UTC
From: rcrusoe@aol.com
Message-ID: <1998052519564200.PAA11889@ladder03.news.aol.com>
Source record: 82580

Anybody have any experience or ideas on building crystal filters for a first IF of 25 to 30 MHz? I was thinking particularly about using CB overtone crystals from Rat Shack. Is this do-able? Those crystals sure are cheap, and should have pretty decet tolerance and so it should be possible to find 3 or 4 pretty closely matched. I would like to see a 6 or 7 KHz wide first IF to allow decent SWLing as well as CW etc, and have all the selectivity at the second IF. Are CB crystals third overtone units? How much attention must be given to the problem of passing the fundamental frequency? Will a filter made from overtone crystals pass the overtone frequency? I have never built an up-conversion superhet and haven't seen any construction articles either. Should I just stick with a Chebyshev LC filter at first IF? I would like tu use crystals if possible. Also, I would rather not mess with a higher IF than 30 MHz. There are a lot of kits and construction articles on DDS VFOs for the 0 to 30 MHz range, and I would like to use one of these straight up as the LO, and a very low second IF, maybe 50 kHz to allow some use of tunable and bandwidth adjustable op-amp active filters. I know at 30 MHz there might be some trouble with image reception on 10 meters, but I am really not interested in 10 or 12 meters... or CB, for that matter. I figure on using a 23 MHz low pass filter in the front end.

Another question before I heat up the soldering iron... any thoughts on using a regen circuit as a detector? Seems like the regen could be pretty docile if the tuning range is +/- 2 or 3 KHz at the final IF of 50 kHz. This would save me from building a BFO, give more selectivity control, and above all would be a pretty unique application... a Superhet/Regen reciever. I figure on building it on a separate board in the event I decide to replace it with the more conventional mixer/BFO detector.

Any comments or advice will be gratefully recieved.

Source record: 82583

Regards to all,

Thanks a lot Robert and Richard for your kind replies.
You have indeed answered my questions but maybe I should have put it a bit simpler to try and understand what I need to know. For me the mentioning of amplifiers etc are a bit confusing.
Say I hook up a small bulb to a 9 volt battery and I want to use a pot to vary the brightness of the bulb, well, I've sorta done this before but whatever pot I had at hand and used the bulb went from fully OFF to fully ON in about an 8th of a turn at the end of the spindle's travel.
So how do I figure out the proper value of pot needed.
I've no problem with useing a multimeter and have been building kits for years but I think maybe I lack a bit of basic understanding.

Thanks a lot for your time and trouble.

Kind Regards

Terry Gaff

Once again the media (and other foolish types) blame an object for a crime rather than the PERSON who committed it. If the courts in this country would lock up (permanently) or execute all violent criminals the FIRST time they commit a violent crime then maybe teenagers these days would see that crime doesn't pay. And maybe parents these days should expect some responsibility from their children at a younger age instead of letting them run around like wild animals. By the time I was 13 I knew darn well what was right and what was wrong and that my parents would hold me fully responsible for my actions. Today many kids have nothing expected from them until they meet the real world and by then it is too late.

Jim - Be sure that you get the proper plating. Bright silver plate, or non-tarnishing silver plate is very lossy. You want a pure silver. It will have a dull finish when it is plated. Most platers will not give you this type of plating unless you are very specific. I had this problem even when using an in-house plating shop at a large RF manufacturer. - John

I was talking to a couple running a booth at Dayton. They are
from Oregon and sell bags and other goods (like holsters) at
hamfests and gun shows. They were so used to west coast hams
that are very liberal and very anti gun.

They were very surprised that midwest hams are conservative and
usually carry guns. I would guess that the third of the folks
at Dayton had a weapon on them. My guess is that different types
of folks get into amateur radio depending on the area. Midwest
liberals just are not interested in technology.

Silver plating is an electro-chemical process. One way to get silver onto copper is using a solution of silver cyanide AgCN in water, with some additional potassium cyanide KCN. Such solutions are actually sold but are extremely poisonous and it might produce gas if it gets in contact with any acid. Another disadvantage is that you only get a _very_ thin silver layer. Silver is deposited while at the same time copper is solved. As soon as there is a thin layer of silver and thus no more copper to be solved, the process stops. Such a thin layer protects the copper from corrosion but with respect to electrical losses on RF it is not very usefull.

Larger layers of silver can be produces when you apply an external current, but in order to get good results that technique should better be done professionally.

Terry,
The appropriate place to control the audio is just after the pre-amp which feeds the power amp. Depending on the type of circuits used, the right value for your pot may vary, however with most circuits a 10k pot will work. You need to break the audio line between the pre-amp and power amp. Next , hook the middle of the pot to the power amp. Then hook one side of the pot to the line comming from the pre-amp.Then hook the remaining pot lead to ground. The two outside legs of the pot are interchangeable. You can reverse the action of the pot by switching these two leads.Note: this is important. There must not be any D.C. on either of these lines. You may simply isolate the pot with a capacitor on each leg. A 10 microfarad should pass plenty of audio . The positive legs of the caps should go away from the pot. 73 Doug

Hi all.
I'm looking for a tiny 2m FM Receiver. I'm trying to build a
DTMF pager and I need a very small receiver, preferably under 2x2
inches. If anyone has any ideas, I'd love to hear them! Please
post back to this list or feel free to email me at aporr@coil.com
thanks!!

True.

>I don't think it affects receive - the UARTS
>I've looked at should only need the first stop bit to end the character.

However, many simple devices do not use an UART, but instead use a
software loop to wait for the first stop bit. Some time is required
for processing of the assembled character before the next character
starts. I have seen one device that definitely required two stop bits
on 1200 bit/s and did not get a single message correct with only one
stop bit. Even with two stop bits from a fast computer, I had to add
some intercharacter delay for completely reliable operation.

>So a computer set for N/8/1 should talk to a radio set for N/8/2.

It is always safe to have the _receiver_ at one stop bit (if the
receiver supports it) and the transmitter at two stop bits. This just
extends the mark time between the end of the last data bit before the
start bit of the next character.

This is problematic situation if there is a duplex link, since I have
never heard of split-stopbit (1/2) UARTS :-)

Skin effect is very definitely significantly significant at HF. At 10 MHz, the skin depth is about 0.8 mils in copper. In fact, that's one reason silver plating makes so little difference. The DC conductivity of silver is only about 6% greater than that of copper. But because of skin effect, the skin depth is shallower in silver than copper, resulting in an RF conductivity improvement of only the square root of this, or about 3%, if the plating is several skin depths thick. (Otherwise, the improvement is less.)

If you coat a wire with a perfect insulator, there's no additional loss due to the insulation. If you coat it with a conductor of the same type as the wire, there's also no additional loss. The loss becomes significant when the coating is a poor conductor -- poorer than the original wire but not so poor as to be an insulator. The poorer the conductor, the greater the skin depth. So for a thin coating, as the

conductor gets poorer, more current flows in the underlying copper compared to the current in the lossy coating. It's a tricky problem unless the coating is thick enough that essentially all the current flows in it.

Both copper and silver corrode, each with a number of different compounds depending on the environment. It's difficult to find the resistivities of these compounds, but here are a few, from the 1993 _CRC Handbook of Chemistry and Physics_:

Cu2O 10-50 ohm-m
CuO 6000 ohm-m
CuS 0.3 to 83 X 10^-6 ohm-m
AgS 1.5 to 2.0 X 10^-3 ohm-m
Cu2S 80 to 100 X 10^-6 ohm-m

Compare these to copper at 1.72 X 10^-8 ohm-m.

I haven't done the calculations, but suspect that CuO and Cu2O corrosion wouldn't cause much loss because they're such poor conductors. I don't know about the remaining ones, but silver sulfide (AgS, common black tarnish) might be as lossy as or more lossy than common copper films. It would, of course, depend on the depth of the coating. The only conclusion I've drawn from this is that I won't make a blanket prediction about whether a tarnished silver coating is more or less lossy than an oxidized (or sulfided or chlorided) copper coating.

It is inevitable that both the copper, and the silver will oxidize over time. This creates a problem with copper, however it is actually beneficial to silver since silver oxide is a better conductor than silver. This is why you should not clean the tarnish off silver electrical components.

Can anyone tell me where I may be able to get information on the Uniden presidential Mobile radio line. I have gone to the Uniden web page and they have the "Washington" listed, but no picture or information available. I like the 10 meter aspect, but on road trips I also like the road information you just cannot find on 146.520 and the Kenwood TS-140S is too large in the 90 Nissan Pick-up.

Your assistance is appreciated.

You might want to try just adding a load across the 12V line to the 242 which would quickly discharge the caps in a second or two when power is removed. Just adding a 150 ohm resistor would probably do the job and would waste about one watt (and that only when the switch is ON).

Isolating the 242 with a big diode should also work, but would drop the voltage to it (about a quarter volt if you could find a big Germanium diode - about three quarters volt if Silicon)

On Mon, 25 May 1998 08:39:37 -0400, Bob Lewis <aa4pb@erols.com> wrote:

>Kind Regards
>
>T

In this instance, Terry, you need to use another resistor in series to "dilute"
the action of the pot. What this does is reduce the effect of the pot so that
1/8 turn or whatever does not span the entire operating range of the load.
But... what this will do is increase the minimum resistance, possibly above the
range where it most be. So, in addition to the series resistor, you need
another one in parallel. The Series resistor sets the minimum resistance of
the circuit, and the series one sets the maximum. The maximum resistance of
the circuit cannot possibly be more than the resistance of the parallel
resistor.

As you know, series resistance is added together. Parallel resistance is
calculated differently. The sum of parallel resistances is the inverse of the
sum of the inverses of the separate parallel resistances. In other words, if
you have a 10k and a 5k resistor in parallel, 1/(1/10000 + 1/5000) = 1/(.0001
+ ..0002) =1/.0003 = 3333 ohms.

By the way... you need to find the required operating range of the circuit
before designing it. With your pot in the circuit, adjust to the lower cutoff.
Take it out and measure the resistance. Put it back in and find the upper
cutoff. Measure that resistance. Then design your circuit. To avoid the use
of the parallel resistor, try to find a pot with a value equal to the

DIFFERENCE between the upper and lower operating limit, and use a series resistor equal to the minimum value. With the pot set to zero, the minimum value will still be provided by the fixed series resistor. With the pot set to max resistance, the sum of the two resistors will equal the max operating resistance. Now, your end to end span of the pot will coincide with the upper and lower cutoff. In all likelyhood you will not find a unit with the exact resistance required, and so you will trim with a parallel resistor.

The same tricks work with inductors and capacitors as with resistors, with one important difference... Capacitors work backwards. Parallel capacitances are additive, and series capacitances are summed by calculating the inverse of the sum of the inverses of the parallel capacitances.

Note that a potentiometer can be hooked up in series with the load and the wiper terminal tied to one of the end terminals, or the pot can be in parallel with the source, and the wiper and either terminal connected to the load. In this application, moving the wiper towards one end or the other sets the voltage nearer the max or min value.

Practice designing and calculating values for a few resistive networks. I believe the General class study guide has a few problems of this type. Understanding simple networks like this is an essential prerequisite for any real circuit design.

Hope I managed to keep the baffle factor down. It is sure easier to show some things than to tell them.

Check out the November 1994 QST for a very slick homebrew approach to a loop tuning capacitor. It is a split-stator unit, which maintains the balance of the loop. The rotor is a U-shaped assembly of copper pipe, 1/2" ID. The two legs are covered with Teflon insulation and insert into the two stators made of 3/4" ID copper pipe. The two stator pipes connect to the open ends of the loop with 90 degree elbows so that the two stators are parallel and pointing into the loop. A motor and screw arrangement pulls or pushes the rotor into/out of the larger diameter stators. This is definitely the way to go for a 100W single turn compact loop. Bill Jones, KD7S wrote the article, so you might do a web search on his call sign. By the way, a simple Gamma match was used in the article. Most homebrew loops use a coupling loop, and sometimes that loop has it's own capacitor as well. The Gamma match looks good for me.

G'day everybody,

I have a Thompson TH293 tube for sale.
It delivers 5KW (yes, kilowatts), up to 1 gigahertz.
It's a new tube, and I have never used it, because of the power it
consumes. It comes with datasheets.

Make an offer and I'll reply.

Transport can cost quite a lot, because it's a big, heavy tube. I live
in the netherlands.

5327. Digital PLL filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-26 00:00:00 UTC
From: Vincent Habchi <vincent.habchi@art.alcatel.fr>
Message-ID: <356A736F.EA590DC0@art.alcatel.fr>
Source record: 82595

Hi there,

I (still) intend to build a precise frequency-meter whose local clock
(already supplied by an OCXO) would be locked on an aired reference such
as WWV (more precisely, in my case, France's Allouis 162 kHz TDF signal).
I didn't go very far - but already monthes ago, somebody told me that such
a PLL would require a loop with a time constant longer than one day, to
compensate for propagation discrepancies between night and day (I receive
the TDF signal via ground-wave). Considering that implementing a fonctional
loop filter with > 10 Mohms resistors and > 1mF capacities seems fanciful to
me, I suddently realized (!) that I could do it digitally by sampling the
phase error signal at a very low rate (such as 0,01 Hz or less), performing
the required computation and retransforming it into a suitable analog control
signal.

Has anybody out here done this before ? Any clue or any advice ?

Moreover, since the device already requires a ï¿½-controller for final
count and display driving, that would not add any further hardware complexity
besides the DAC - the low sampling rate would certainly not overload the CPU !

Bye and 73s
Vincent, F5RCS

Terminals almost always use magnetic deflection and ferrite yoke cores.

To be strictly truthful, you COULD turn it into an oscilloscope, and
"plans" have been on sale for years for converting old TVs - which
amount to similar technology, BUT you get very little bandwidth.
Let's just say that it won't convert directly into a useful
oscilloscope.

You could build a digitising sampling oscilloscope front-end of any
performance you fancy, interface it to a computer, and use the terminal
as a terminal to display the results. You ought to assess the amount of
effort needed versus the availability of second-hand high quality
scopes, though.

If you attempt either of these things, you'll learn a lot. However, they
are simply not worth attempting for any reason other than curiosity.

> some other books, but couldn't find anything. Is there any use for this
> odd little PCB, other than parts?

You've hit the main use!, a second use might be as a spare to repair
another of whatever system it came from. It may not cover a frequency
range of any interest to you. It can be educational tracing out the
circuit and working out how it functions, and what performance it
offers.

There is quite a lot in ARRL handbooks about voltage controlled oscillators, but it's targetted at RF oscillators tuned by voltage-controlled capacitors in the form of varactor diodes (aka varicap diodes, tuning diodes etc etc.) You'll find it in chapter 14 in 1995 and later editions, along with info on frequency synthesisers based on voltage controlled oscillators. You won't find piles of circuits, but you will find a lot of explanation of how the things work, and how to make improved ones.

Cheers
David GM4ZNX

5329. SOFTWARE FROM HELL: "COREL, INC."

Attention Fellow Computer Enthusiast:

***** C O M P U T E R S O F T W A R E F R A U D A L E R T *****

%%%%%%%%%% C O R E L S O F T W A R E E X P O S E D %%%%%%%%%%

HERE'S A TIP TO HELP YOU AVOID SOME FUTURE GRIEF (AND SAVE SOME OF YOUR HARD EARNED MONEY)

PC World Magazine, in their February issue made reference to a particular software title as

'THE SOFTWARE FROM HELL'.

I've never used the product they were referring to, so I can't comment about it.

Nevertheless, if PC World had been talking about software from

COREL CORPORATION (Word Perfect, etc), it would have been MOST APPROPRIATE.

COREL SOFTWARE PRODUCTS, IN ALL THEIR FORMS, TRULY DESERVE THE TITLE

****** S O F T W A R E F R O M H E L L ******

because they are buggy (and dysfunctional) beyond belief. Corel products make Microsoft look like the knight in shinning armor, even including Windoze 95.

YOU CAN'T READ INFO LIKE THIS IN THE COMPUTER MAGAZINES BECAUSE COREL SPENDS FAR TOO MUCH MONEY VIA ADVERTISING REVENUE WITH ALL THE COMPUTER PUBLICATIONS, AND THEY DON'T DARE EXPOSE ONE OF THEIR BIGGEST ADVERTISERS, FOR REASONS WHICH SHOULD BE OBVIOUS. THEREFORE, WE CAN ONLY HOPE TO PASS THE WORD VIA NEWS GROUPS AND SIMILAR OUTLETS.

Corel Corporation, a Canadian firm, based in Ottawa, Ontario, has zero regard and zero respect for their customers, and is probably the best example of why Ziff Davis (publishers of dozens of computer magazines, both on the PC and Mac platforms), are now calling for a mandatory (and legally binding) 30, 60 or 90 day software money back guarantee.

Using data from Corel's own website, the following is more than sufficient proof to demonstrate the dysfunctional character of Corel's Word Perfect product:

THE FOLLOWING BUG LIST IS TAKEN FROM COREL'S WORLD WIDE WEBSITE:
==========

ftp://ftp.corel.com/pub/WordPerfect/wpmac/-WPMac ftp Index.html

(scroll way down, almost to the bottom)

What follows is the list of bug fixes initiated by Corel in an attempt to repair their cockroach infested product known as Word Perfect, version 3.5, which can easily be construed as a clear admission of bugs which existed with version 3.5 as shipped to customers on CD ROM. What makes this issue all the more criminal is the fact that Corel refused to inform customers who sent in their warranty registration cards that bug fixes had been released for this product. Corel Corporation refused to send warranty/registered customers the patches on floppy disk, and if this was too expensive, Corel Corporation even refused to send registered customers a postcard informing their customers where they could find the patches on the Internet. Customers were simply left to struggle with a totally dysfunctional product. And customers like myself who finally figured out Corel Word Perfect could NOT be made to function properly, and who first requested assistance, were ignored, and who later requested a refund, were also ignored.

TO THIS DAY, 17 MONTHS AFTER THE PURCHASE OF THE DYSFUNCTION AND COCKROACH INFESTED COREL WORD PERFECT PROGRAM, THIS COMPANY CONTINUES TO IGNORE ALL INTERNET E-MAIL MESSGES AND ALL UNITED STATES AND CANADIAN POSTAL SERVICES LETTERS.

==========

Corel Document ID: 10339

The information in this document applies to:
WordPerfect 3.5 for Macintosh

This Updater works with all versions of Corel WordPerfect 3.5. Including: Novell WordPerfect 3.5, Corel WordPerfect 3.5.1, Corel WordPerfect 3.5.2 and Corel WordPerfect in the CorelDraw Suite.

The Corel WordPerfect 3.5.3 patch replaces all previous patches for WordPerfect 3.5, including the Corel WordPerfect 3.5.2 patch shipped in October of 1996.

Fixes in 3.5.3 patch
==========

- Conversions should now function normally under System 7.6.
- A bug was fixed that repairs some display problems.
- Sporadic warnings that the common library could not be found will no longer occur.

Fixes in 3.5.2 patch
==========

- Text Selection now works properly.

- The Print Envelope feature will print addresses in the correct position on the LaserWriter 8.4 printer driver.

- Deleting to the right at the beginning of a line will no longer cause the cursor to reposition incorrectly in the text above.

- Deleting just before a Style no longer causes the cursor to reposition incorrectly and delete text within the Style.

- Editing a document in ?Show Codes? no longer causes the cursor to reposition incorrectly.

- Headers/Footers with text attributes (bold, underline...) are no longer affected by text attributes that cross a page break.

- Deleting addresses in the Print Envelope delivery or return address window now functions properly.

- The German Dictionary no longer stops and marks incorrect every word that contains a ? (esset).

- The French Dictionary on a Power Macintosh no longer stops and marks incorrect words that contain a ? (acute).

- Delivery Point of a bar code is no longer automatically calculated.

- Import of tables from various document types has been improved.

- The title of the ?WP6.x Export? now reads ?WP6.x,7.x Export? in both the patched and resale CD product from Corel.

- HTML export now saves Corel WordPerfect graphics or .wpg formatted images as JPEG?s.

Fixes in 3.5.1 patch
====================

- Editing some long blocks of Japanese characters will not crash the computer.

- Screen display is faster after scrolling through large documents or tables, or making editing changes.

- Captions can now be positioned above a graphic or text box.

- Return and delivery addresses in Print Envelope will now allow 255 characters (including line breaks).

- Dictionaries are now listed under the Dictionary menu instead of the Check menu.

- Ruler Bar display problems with PCI Power Macintosh computers have been fixed.

- WP 6.x and WP 7.x conversions can now be canceled.

- While working in subdocuments?such as headers or footnotes on black and white screens, Corel WordPerfect does not quit unexpectedly when clicking in the ruler area of the subdocument.

- Zip codes beginning with zero which did not have extended zip code digits now function properly in the Print Envelope feature.

- Font menus in Preferences and Print Envelopes now work properly on small monitors.

- Cleared tabs will no longer unexpectedly reappear on the ruler.

- Hyperlink copy and paste are now working.

- Cell Protection now disables the deletion of the contents of a cell.

- The bottom border of a table which crosses a page break is now visible.

- Patterns in a cell will no longer disappear when performing a Split or Join.

- Joining with the first cell of a table now functions properly.

- Row selection of tables in a text box is now available.

- Scroll bar does not stick when scrolling.

- Corel WordPerfect will use the Language Resource file designed for your system if present, or default to English (USA).

- Page Setup is now enabled in the Print Envelope feature (this allows the selection of paper sizes and envelope trays).

- Changing QuickCorrect preferences with no documents open will no longer crash the computer.

- Tables and Page Borders now work together.

- The PowerTalk Mailer can exceed 4096 characters.

- In the new Corel WordPerfect 3.5 CD-ROM, Norton Utilities will no longer report an error in the WordPerfect Installer Read Me. This fix is not available in the patch, but if you use Norton Utilities, we suggest you delete the WordPerfect Installer Read Me since it is not required for proper operation of the software.

- Corel WordPerfect Dictionaries and QuickCorrect word lists will no longer be replaced during installation.

==========

Postscript:

The above represents the bug list for Word Perfect 3.5, as I purchased this product, these revelations coming directly from Corel's website. Considering all these problems, it is little wonder that Ziff Davis Publishers are now suggesting we have a SOFTWARE LEMON LAW to protect computer consumers from future issues of this sort of software larceny.

If the reader will examine the websites of PC Week, PC World, and a few other leading PC-platform computer magazines, he will discover that Corel's Word Perfect, Suite 8 (the latest offering from Corel) is likewise

full of bugs. Don't take my word for it--- check it out for yourself.

MORAL OF STORY::::

SAVE YOUR MONEY--- DO NOT BUY ANYTHING WITH ���COREL��� ON THE LABEL, WHETHER IT BE FOR IBM COMPATIBLES OR THE MACINTOSH !!!

It's easy to show by calculation, and verify by measurement, that even thick silver plating has a very, very small effect on loss at RF. I don't believe you'd even be able to measure the difference under most circumstances. A thin layer should be adequate for the chief function of silver plating, which is to make the coil look pretty.

Turn the pot until the lamp is just at the dimmest that you want to be
able to control. Without rotating the knob, disconnect the battery and
now measure the resistance across the pot leads that you are using to
connect to the lamp and the battery (still disconnected). The value you
read is "the proper value of the pot needed." As someone else said,
you can synthesize this value with a pot of higher value, and a series and
a parallel resistor.

Speakers are usually 8 ohms. Try a 1 k pot in series with the speaker for
starters. If it's too quiet at the quietest, decrease the value. If it's
still too loud at the quietest, increase it. Come to think of it, you
can used fixed resistors to see at what value gives a good quietest level.
Then use a pot at this value. "Log taper" pots will have smooth volume
control, if you can find a log taper pot of the right value it would be
best. "Linear taper" pots will have the loud and mid-volume zone all
bunched up near one extreme of the rotation, making precise adjustment
more difficult when you want it loud or medium loud.

If you are unsure about which taper your pots have, you can find out
yourself with a meter: measure the resistance of the pot at 1/4, 1/2, and
3/4 of the knob rotation. Linear taper pots will have about equal
increments of resistance; log taper pots will be grossly unequal, much
more unequal than your possibly inexact estimation of where these
fractional angles are.

Hi the name is Lloyd, I have a sinclair model Q-202 duplexer for sale, and I am
asking $425 in Canadian funds, for those of you in the USA, that is about $277
in your money. This unit was hamified, by a pile of would be ham tech's, you
know the type, big mouth knows everything about everything, has no test equipment
only a hammer and screw drive, and will fix anything anywhere. Well this
got fixed !!

So what is the problem with it? Well some super tech's redesign the phaseing harnness
as they know more then any real engineer dose, right ? So here is the deal, I have
tested each can on my HP network analyzer and each can checks out OK with about
.4 to .5 dB of loss per can. So all it really needs is a new harness, and a REAL tech
with REAL test equipment to set it up and tune it. The $425 includes shipping as long
as it is not over $35, anything above that and you will have to pick up the extra.
I can be reached at my shop at {604} 990-4130 or by email at novatech@mail.direct.ca
And last of all NO would-be ham tech's that think all you need is a hammer and screw
driver to fix anything. Or any hams that think, gee if my FT-890 puts out 100 watts
with 12 volts DC input, what would it put out on 220 volts AC. And if you think I am
trying to be funny, you should have been here to see the rig that, that was done to in real
life !!! No joke, I had a FT-890 on my bench that was pluged into a 40 Amp stove
plug ! Now that took some real brains, or the lack of.

Our "RIGHTS" come from God and given by him to "The People" in the USA
who in turn "loan" to our government what is needed to manage our
nation. In European and Socialist countries they believe that the
"rights" (power) comes from God and go to the King (or government) who
then loans those rights to the people (their subjects). This concept
is what makes the USA so unique.

Radio Shack sells "L" pads made exactly for this purpose. They are typically used when you want to control the volume of each speaker (say in separate rooms) independently.

Are you certain you mean developer? I suspect you mean the fixer,
which is what removes the unexposed silver halide after development.
For what it is worth, color films also use silver halides, though
the silver is completely removed and replaced with dyes. Again,
the silver ends up in the fixer and bleach, my understanding is that
professional labs send out used chemicals for silver recovery.

One of these days I'll try soaking some copper in the used fixer
I've saved.

Using two stop bits instead of one just increases the inter-character
time during transmit. I don't think it affects receive - the UARTS
I've looked at should only need the first stop bit to end the character.

So a computer set for N/8/1 should talk to a radio set for N/8/2.

>Interested in the comments about silver plating coils, I agree it is
largely cosmetic at HF and it stops the copper from tarnishing or corroding,
but I have always wondered if that really matters either? If you think
about it the copper below the surface would be effectively in parallel with
the corroded outer, so wouldn't the rf simply take the path of least
resistance ? I suppose you could argue that the cross sectional area has
been reduced but that would take an awful lot of corrosion to be
significant.

The popular Zilog SCC (Z8530, i82530, etc.) gives the option of 1.5 stop-bits, the 8250/16450/16550 will generate 1.5 stop-bits when using a 5-bit word length, and I vaguely recall other UARTs supporting 1.5 stop-bits.

What a silly rant, buttressed by the PC (politically correct) Ziff-Davis marketing machine.

If you are going to use a Mac, why not make asute choices regarding what applications function well on it? Many do the WP job emminently on a Mac.

I've been using WPWIN 6.0 & 6.1 for a long time in pers & biz, done all manner of DTP with it, selling several millions in R/E with its ease of producing excellent flyers & brochures beyond the far more costly R/E software. It is a powerhouse product that has more OPERABLE features than anyone can learn in four years (or needs). Support has always been shitty - and it is everywhere unless it's at $24.99 per call - and Micro$loth is surely no better; even their website knowledge base is inferior to their old BBS.

The only beef I've had with WP it it's gargantuan size and resource-hogging - but look at MS Word, a big dog if there ever was one, woth far less to offer (I run it as well - as little as possible).

You'd think someone into the hands-on & tech know-how to mess with BA's would be away from the dumbed-down Mac & Windoze OS's, and into unix, with which you actually control your own box (and have to know something).

Boy, this submitter REALLY helped me fix boatanchors, yes?

5345. charging SLA batteries

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-27 00:00:00 UTC
From: dbyoung@sfu.ca
Message-ID: <6khl9etbt1@nnrp1.dejanews.com>
Source record: 82526

I've got a quick question here. I have a couple of SLA's that are all 12V. The charger that came with one of them (the 7.0AH one) which looks like just a AC-DC adaptor is rated at 12V (according to what's on the adaptor/transformer). However, when I measure the voltage across the outputs, I get a reading of 16-17.5V?? Is it supposed to be like this? Or is the charger under/over-rated? Shouldn't SLA's be charged at around 13.5V. Will continual use of this 'charger' (which I think is simply a bad 12V power supply) damage the battery by supplying an over-voltage?

I also have a wall transformer which converts AC to DC (car adaptor/cigarette socket style) 12V, when I measure the output from that, it also says around 17V instead of the rated 12V? Assuming my DMM is accurate, what's with all these transformers, are they just cheap or poorly made and have a 50% of error? Or am I not considering something here, like when I connect the terminals of the SLA charger to my 1270 battery and then measure the voltage across, it drops to about 14V.

thanks for the info

Hej!
Du menar väl 100 pF kondensatorer. Verkar lite litet. Kan rekommendera
2 st. vridkond. på vardera 500 pF. För 160m måste du ha ännu mera.
Sen kan du göra ett PI-filter.

FT-50 (and VX-1 and IC-T[278] and ...) uses 9600,N,8,1.

You might like to look at my Linux-based programming software, which
supports FT-50,
VX-1 (and soon IC-T7, -T8 and -T2). The package includes protocol and
data descriptions
which might be very useful. It's free and available from

ftp://ftp.funet.fi/pub/ham/rigctrl/linux/yaesu-0.2alpha.tgz

Message-ID: <356C1BC7.9AFBB714@admin.con2.ns.com>
Source record: 82530

Has any one tried this? I see it has an FM voltage source so it looks possible. If this is possible, it would be a much cheaper alternative to learning how to build radio receivers and transmitters. For those of you who don't know what I'm talking about, PSpice is an electronic circuit simulator. From their web page: "It is PC-based, no-compromise EDA software, acclaimed as the world's most accurate, robust, and tightly integrated analog/digital simulation program." You can download a demo version at http://www.microsim.com/. The limit on the demo is the number of parts you can have in the circuit - it certainly allows enough for a basic transmitter or receiver.

Anyway, if anyone is using this program, I'd like to hear from you. Maybe you can help me get started with it? Thanks.

And in fact it does work. I finally tried it last night. There is an option to add some delay between characters in the Stramp Basic SEROUT command. Adding just a couple milliseconds seems to do the trick. Likewise, there is a software settable option in the Yaesu called "pacing" which allows delays between bytes returned from the radio to the computer.

So thanks to all for your help. Still a long ways to go on the software for this project. I'm modifying the Remote Base Controller (May QST) for use with Yaesu's. Will post all when completed. In the meantime, I know I'll be back with some more questions.

Learning about RF with a copy of PSpice would be a lot like learning
about sex with a copy of Playboy. Turn off your computer, warm up your
soldering iron, and hit the ARRL Handbook instead.

I'd really like to see some substantiation of this statement. Copper oxides are listed in the above table. Do you have the value for silver oxide for comparison? I'm very skeptical that silver oxide is more conductive than silver, but have never seen the resistivity or conductivity of silver oxide published.

I'm not a chemist, so don't know what salts are commonly formed, but was under the impression that silver commonly forms silver sulfide (common black tarnish), not oxide. And copper, I believe, forms oxides, chlorides, and sulfides depending on the environment. Can anyone comment further on this? Does anyone know the conductivity/resistivity of silver oxide and how common it is?

I wrote a note to G3VA about a two-xtal 18.556MHz roofing filter. The
filter is designed by LA7MI Stein Torp. The filter is used in his 40dBm
IP HF receiver project. It is presented in Technical topics, Radcom Dec
95 pp.71. It uses a pair of 5th overtone 92.8611MHz type HC18/U (HC49)
xtals. Performance: -3dB BW=6kHz , -30dB BW=42kHz, 80dB BW=840kHz,
ultimate rejection is 90dB. Insertion loss is 1.5dB.
Two bifilar wound transformers (2x 16 turns .25mm enam cu wire on T37-2
core) are used with 2x 2-4pF neutralizing capacitors. The filter is
designed for 50 ohm.

The reason for using this frequency is only that the xtals turned out to
have low spurious responses (as measured with HP8505A network analyzer).

The details shown in Radcom are based on correspondence with LA7MI, he
does not have email (not even a PC), he only has a telephone. His

current project is a 40W 80m ssb transceiver with VMOS power amps in SMD technique, with hand cut PCB pattern (using small dentist drills), PA IMD was measured to 20dB. He has made several solidstate 80m ssb transceivers and receivers during the last 30 years. Many of the ideas I have described in Radcom is based on his circuits.

I have a small quantity of brand-new Motorolla MRF-464 matched pairs (SRF3209) in unopened antistatic bags for sale. The RF Parts price is $64. How about $29 a pair?

The Motorola Data Book specifies it for 80 watts PEP and describes it as follows: "designed primarily for applications in a high-power linear amplifiers from 2.0 to 30MHz in single sideband mobile, marine and base station equipment."

Inquiries welcomed! Thanks!

> error?

No, they don't have an "error"! They are rated at 12 volts DC at a specific current drain. If you draw the rated current, you will get the rated voltage. Otherwise, you will get more or less.

Most of these type "supplies" are unregulated and depend on the device being powered to handle any critical regulation issues.

So, in many cases, one of these "wall transformer" supplies may be rated: 10.5 volts DC at 300 ma. You could still use this unit to power a device that required 100 ma at 12 volts DC because the output voltage (at one third the rated current) may very well be 12 volts!!

I am using a similar "supply" to power a scanner. It is rated at 10.8 at 800 ma. But it works OK with the scanner because the scanner draws between 200 and 500 ma. In this case the output is just under 12 volts DC.

All of this is probably related to the old 1.414 times deal for the open circuit voltage of a supply with capacitive input. That is, if the rated voltage of the transformaer is 12 volts AC and you rectify it and use a capacitor as a filter, you will get 1.414 times 12 or about 17 volts out of it with NO load. When fully loaded, the output will be very near 12 volts DC.

So, your meter is OK and so are your "supplies"! But, don't short one of these guys. Some have a internal fuse that is not replaceable. And, be careful about using them "lightly loaded" with devices that are sensitive to over-voltage.

Regards,

Bill

>continual use of this 'charger' (which I think is simply a bad 12V power
>supply) damage the battery by supplying an over-voltage?

All of these cheap wall warts are unregulated DC supplies. If it's
rated at 12 V at 500 mA (for example), then the output will probably
stay above 12 V with that much current drawn, but there will be some
ripple. With no load, the voltage will rise much higher, as you have
measured.

Such supplies will charge a lead-acid battery, but if you leave it
connected it will overcharge the battery. It's the poorest charger
for this type of battery.

A much better charger is a *regulated* power supply that puts out
13.8 VDC. This provides rapid recharge of a 12 V lead-acid battery,
but will not overcharge it - it can remain connected forever.

The only thing you have to watch out for is what happens if the line
power fails while the power supply is connected to the battery.
With some power supplies, nothing bad happens. With others, an output
load resistor slowly discharges the battery. And with some, the presence
of a voltage on the output with no input AC power will damage the supply.

Better yet, you can get chargers specifically designed for charging
lead acid batteries, or build your own charger from one of the custom
ICs. These chargers typically have multiple steps in the charging
process. For example:

- charge at maximum safe current until voltage reaches 14.6 V
- charge at 14.6 V while the current drops to maybe 25% of
the maximum
- reduce voltage to 13.6 volts at low current, providing
continuous float charge

Such a charger provides both the fastest possible recharge, even faster
that the 13.8 volt constant voltage supply, yet also provides the safest
continuous charge. Also, since these are designed specifically as
battery chargers, they should be designed to deal with the possibility
of loss of input power while connected to the battery.

Dave

I have some NOS GEC TT 22 valves in stock. This is a transmitting
valve with a 12.6V heater and a topcap for the anode, but insite it is
a real KT 88. Due to the anodecap, it can handle 1250V.
This valve is now very scarce, and it has always been very expensive.
I have been told that the current price here in Norway was about
NOK 5000 - or about US$ 670.-!!

You will have to pay about US$ 65.- at Billington in England for a
decent USED (but tested) one. I'm asking only US$ 70.- each for new,
unused.
E-mail me if you are interested.

You might take a look at this month's QST --- there's a project described in there called a "cube tamer:" a simple filter+regulator that can be used to regulate the output of randomly selected wall cube transformers. It's remarkably simple: a few 4700 mF electrolytic capacitors, a 7812 voltage regulator, a full-wave rectifier (in case you have an AC-AC wall cube) and some connectors in a little enclosure. That ought to eliminate any concerns of using unregulated transformers to power equipment that expects regulated voltage.

A few years back, I built several small receivers using the MOTOROLA MC33032 (?forgot the exact number) series of part. They offered a surface mount version of that part if you really want to make it tiny, but I used the 18pin skinny-DIP version (0.3" pin spacing). Its a good receiver in a small package, you just add a crystal or synthesizer VCO for the 1st LO, a 10.240 MHZ crystal for the 2nd LO and 455KHZ ceramic filter of your choice. Also, a quadrature coil from an old FM radio and AF amp. I did a fair amount of playing with the Q of of this quad coil, and did map out the response of this detector. A squelch circuit is provided, but I played a bit with that portion as it was a bit noisy.

It also required a decent RF AMP, I used a grounded-gate FET to match into its 300ohm input of its mixer. Having access to an HP noise figure test setup sure did help.

This chip was meant for the cordless phone market. Perhaps with some dead phones floating around, you could just scavenge a board out of those for modifying.

Radio Shack sold a interesting one-chip FM radio that used no coils. It used a (I believe) 80KHZ IF, so all the filtering can be done with R/C components at that frequency. I believe their part was manufactured by Phillips or Signetics -again no numbers come to mind. But perhaps you can find one of these chips laying around in a store near you. Good luck my friend.

>bits, the 8250/16450/16550 will generate 1.5 stop-bits when using a
>5-bit word length, and I vaguely recall other UARTs supporting 1.5
>stop-bits.

I must have used inaccurate terminology, since by split stop bits I
was referencing to 1 stop bit in Rx and 2 stop bits in Tx (or 2 Sbits
in Rx and 1 Sbits in Tx). This is definitely not the same as 1.5 stops
:-). You can set most UARTs to 1, 1.5 or 2 stop bits, but I haven't
seen one in which the transmitter works with 2 Sbits and the Rx with 1
Sbit in full duplex.

Having a full duplex link with both transmitters using 2 Sbits and
both receivers using 1 Sbit would require split-stopbits support at
both ends of the link. So it is much more practical to run the whole
system (both ends) at 2 stop bits, if one receiver requires 2 stop
bits.

Compare this to 75/1200 split-speed, this is not 0.0625 speed or
637.5 (arithmetic mean) nor 300 bit/s (geometric mean).

Sorry, David, we'll just have to agree to disagree on this one.

I have spent WAY too much time explaining the basics of wiring layout, parasitic reactances, ground planes, power-supply bypassing, and other real-world fundamentals to newly-minted MSEEs who learned everything in PSpice except which end of a soldering iron to pick up.

You cannot "learn how to build receivers and transmitters" (the original poster's words) by simulating FM sources in PSpice, any more than you can learn how to ride a bicycle by watching the Tour de France on ESPN.

Circuit simulators should be thought of as useful tools, not ends in themselves. You wouldn't be too excited to read a message saying "I just bought an oscilloscope at a garage sale, how can I use it to build a receiver?", would you? Same principle. No, to answer your question, I am not interested in helping the "learner" on his "chosen path"... but I'd be very interested in helping him choose a different path, assuming he is interested in actually building something.

5371. Local wireless link to desktop?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-27 00:00:00 UTC
From: Jeffrey Perry <j.perry@lynx.dac.neu.edu>
Message-ID: <356CE0A0.56B90372@lynx.dac.neu.edu>
Source record: 82552
Cross-posted to:
comp.sys.pen,rec.radio.amateur.homebrew,comp.sys.palmtops,comp.sys.palmtops.pilot,sci.electronics.misc,comp.dcom.lans

I would love to be able to walk around my house with a PDA such as the palmpilot and have a wireless
link back to my desktop. I would run VNC (a remote control program similar to pcanywhere but which
supports both X windows and Windows machines)

I know wireless modems exist for PDAs and wireless data services exist. Does anyone know if there
are products which provide a wireless local link (without charging for a service) back to your desktop? This would be much like hose vcr extenders and would probably operate on similar frequencies.

How hard would it be to build a wireless modem of this sort?

Anyone hear of the Bluetooth research going on at Intel which sounds like the perfect technology
for this sort of project.? What do you think of it?

They plan to run in the 2.4 ghz range. Seems like a neat homebrew project
for us hams to take on. We could perhaps even use the same frequencies Intel is planning
(so nonhams could benefit) and plan to implement the bluetooth protocol when it is ready (if they
even have a protocol - I think it is just a physical layer and they plan to sell a chip which implements it)

An alternative shorter term solution for me, might be to find a few wiireless network cards for my pcs.
Anyone know ones which work with Linux and are reasonable cheap at flea markets or other
discount sources?

Please cc me, if you reply to the newsgroup. Also I suggest the electronics newsgroup or the homebrew
newsgroup for most of the followups.

Thanks!

Jeffrey Perry

>Roy Lewallen, W7EL

Sorry, but I don't have that information available. I'm not a chemist
either, nor do I even have much experience in the electronic field. My
expertise is in electrical field. I learned about the conductivity of silver
oxide in a classroom environment several years ago, and have read references
to it few times since. I was initially surprised to find out that it
oxidized.
It appears to be common knowledge within the electrical industry that
the oxidized silver conducts better than new silver, which is why it is used
commonly in better quality equipment, and why maintenance personnel are
trained not to remove the oxidation.

There is no doubt that he would have killed them any way this NICE
LITTLE BOY was found to have at least 3 bombs that were made out of
common household items that are in almost every house. But we can
eliminate this problem by banning or at least registering and having a
waiting period on these every day items or maybe ban ar register the
knowledge. What do you think? Ban or register every chemistry book and

teacher in this country and make sure we include an import ban on all common household material that could be combined in some manner to create a bomb. How does this sound?

Thanks for a very interesting reply. If I was willing to give up the 17 meter
band and be satisfied with downconversion on 15 meters, that would be just the
type of filter for my project. Interesting that it uses overtone crystals but
at the fundamental frequency. Our CB band is 11 meters, around 27 MHz, and LO
crystals are available for the old crystal controlled sets. I thought about a
4 pole filter at a 26 or 27 MHz IF would be perfect, but I don't know if such a
filter is practical using overtone crystals at the overtone freq or not. I
guess I will go ahead and start on the project (already have the audio stage
half complete) and try the CB Xtals in a Cohn filter, and if it proves
impractical I'll just use LC filtering and rely on the 2nd IF for selectivity.

Learning about RF with the ARRL Handbook might be a lot like learning
about sex with a hard-core video and the girl/boy next door ;-)

I'll agree that it isn't always obvious how to use SPICE correctly for
RF simulation, but I can't agree that this invalidates SPICE as a
learning tool.

The trick to using SPICE is to understand that it offers generally ideal
components. Real components behave differently, particularly at RF.
Accurate simulation requires including parasitic elements.

Approaching RF design from a strongly empirical perspective glosses
over the difference between the ideal and the real. Hams will just
build a circuit and tinker with it until it seems to work OK. On the
other hand, you can design a circuit with SPICE, simulate it, build
it for real - and find the real circuit doesn't behave like the
simulation. However, if you're careful to use the best models you
can find, and accurately model component imperfections, the difference
between the simulated and real circuits can be nearly eliminated.
Once you've learned how to do this, you've got an amazingly powerful
tool on your side, much more powerful than a soldering iron and a
set of tools to tweak a circuit into operation.

SPICE is a valuable tool, allowing one to synthesize, evaluate and
modify a circuit rapidly and at no cost other than time. It offers
the equivalent of a large array of test instrumentation that most
people don't have with their soldering iron and ARRL handbook. Don't
tell people not to use SPICE - tell them to learn how to use it
effectively. SPICE isn't gospel, but it is a very powerful tool.

5377. Mic Wire an Icom 706

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-28 00:00:00 UTC
From: chaos <chaos@onlinemac.com>
Message-ID: <01bd89e8$ec8fb1a0$ca1ac8cc@chaos.onlinemac.com>
Source record: 82461

I would like to know how to wire up a 5 pin power mic for an Icom 706.

I have a mic thats wired for a Cobra 148 radio and would like to be able to to put it on my Icom, since the stock mic sucks for modulation!

I have already bought an adapter for my mic and have a 8 pin modular plug for the Icom. What I want to do is just make a short patch cord between the two, so that I can still use my mic on my 148 Cobra.

I just need to know the mic wiring?

Any help would be greatly appreciated!!!!!!!!!!!

Thanx

Source record: 82464

Your post brings to mind an article in QST by Rohde about the design of crystal filters. I thought I had it handy, but can't find it. I think it must have been around 1981. It included a BASIC program for the design. There was a table of various filters, and at leat one of them was above 30MHz. If this is sounding vague, it's because I can't remember much more about the article, but I know I remember this much because I was curious about building a roofing filter around 45MHz or so once.

If you can settle for a wider roofing filter, remember that 21.7MHz is a reasonably common IF for FM communications equipment, and myabe you could get by with a couple of those cascaded, and then the ultimate selectivity lower in frequency. I know it would depend on how high performance a receiver you want. I pulled some out of pagers. I don't know where to get them, but there was a time when you'd see 45MHz filters for FM communications receivers and again while they aren't really narrow, they might be a start.

A couple of years ago, I bought an old style cellular phone at a church rummage sale for fifty cents. I had it apart as soon as I got it home. I was pleased to find a crystal filter up in the 80MHz range, and the crystal to drop it down to 455KHz, which works out well since you don't have to track down a crystal for the second conversion once you find the filter. I bought another cellphone the other day for a bit more, and it had an 87MHz first filter. But after the initial delight of finding them, there is the reality of building the local oscillator that starts up in that range and I guess I'm not quite prepared to start that. Something a bit lower, especially when trying to build something comparatively simple, seems like a better choice.

I've wondered about helicals or small cavities in the first IF, but again you have to use a fairly high first IF if you want something reasonably small.

If you're thinking of using an LC filter in the first IF, unless you are prepared to cascade a number of tuned circuits, you may be better off with an FM filter at 21.4MHz.

I don't know about the regenerative detector, but I think one of the things that keeps us from trying new things is the concept of a slick box. Put together a good mixer, the local oscillator (of whatever kind) and maybe the roofing filter in one box and you are well ahead. You can have the front end filtering in a separate box (so you can try things like just a low pass filter, or a tuneable filter or small segment broadband filters), and then play around with the rest of it. With DDS or computer controlled PLL's, you can do things like shift the tuning range to adapt to a different frequency IF (not so much with

roofing filters, but I have a number of crystal filters with different
bandwidths, and unfortunately, different center frequencies) and it
would be a fairly smooth transition. Or once you have the front end
taken care of, you can build almost complete receivers after that
for different modes or to try new things. Considering the cost of
semiconductors, the cost would be in the filters not the active components
so you can afford to build whole strips rather than switch the mode or
bandwidth related components.

5381. Packet TNC switching box

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-28 00:00:00 UTC
From: David Cherlin <dcherlin@uriacc.uri.edu>
Message-ID: <356D783D.2AC@uriacc.uri.edu>
Source record: 82465

Hi and thanks for reading.

I would like to construct a switching box that allows me to switch in
either my microphone OR my packet TNC on the same radio (Kenwood TM731A).
There may have been an article in some of the ham publications (QST, 73 Mag
etc) regarding such a project but I am not aware of which issue it may be
in.

The design does not seem to be that difficult. However I do not know of
any sources of the 8-pin plugs, specifically and 8-pin male chassis plug
that mates to the 8-pin microphone female screw-on type plug. Radio Shack
carries the microphone female plug (RS274-025) which does fit my Kenwood
radio.

If you know of any parts suppliers, specifically for this 8-pin male
chassis connector described above or if you know of any articles written
that describes this kind of project, please write to me, tnx.

Wow, this post generated more response than my first which asked for any good book recommendations (of which I received very few).

:You cannot "learn how to build receivers and transmitters" (the original
:poster's words) by simulating FM sources in PSpice, any more than you
:can learn how to ride a bicycle by watching the Tour de France on ESPN.

I don't really understand this analogy. I'm not suggesting I watch someone build a radio. If I understand what you are saying, selecting the right parts and putting them together in the right order has nothing to do with RF design. If this is true, then I can see how a computer simulator would not be useful. From what I can gather from these postings, RF design is accomplished through intuition and guess work - no rational thinking involved. OK then, forget it. I'll stick to digital circuits.

> I don't thing the original poster was talking about joining a religious
> sect. It just sounded like he wanted to have some fun and learn a little.
> PSpice eval version will do just that and for free. Then if he wants to do
> more RF related stuff, he can get the ARRL Radio Designer.

I checked out this title at Amazon.com. They want $150 for it. What's in it? Drugs? Is this book really worth $150? Let me know - and thanks for a cool-headed, helpful response.

And to the anti-computer zealots on thsi newsgroup, I apologize for my original post. I didn't mean to offend anyone.

For those of you that are familiar with older TT equipment.
What are the 68 ohm resistors that connect from the PA
xsistors (MRF458) collectors back to the input transformer
used for? There is a 68ohm 2watt resistor on each collector
that connects to the input xfmr for these xsistors. Looks
like gain levelers, but not sure. I'd like to change to 50 ohm
since these are a bit burned but don't want to change the
gain over freq if that is what these are for.

Hi,
I am trying to rig up an external PTT switch and a mic to a handheld CB radio. I am looking at UNIDEN/Radio Shack and Maxxon models. On radioshack I have found that it has a 2.5 mm mic jack which is also the PTT. How do I activate the PTT. I would like to keep an isolated push button switch to activate PTT and talk into the mic.
On searching the web I found that there are some circuits for connecting TNC in ham radios but those require the mic to be powered externally and I dont want to do that.
Is there anyway I can get the wiring diagrams for connecting an external mic and PTT switch.

Thanks,
Jay Samuel

Don't you believe it. Computer simulation and design programs are very important. They, together with *accurate* theoretical understanding, practical "feel" based on experience, a good tool box and the ability to use all of these in the right proportion, complement and enhance each other in a way that guesswork and intuition alone cannot equal.

Sure it is. FM is allowed anywhere above 50.1 MHz. See 97.305c.

North American TV audio is 25 kHz deviation. 75 kHz deviation is used for
FM Broadcast. So TV audio is considered "medium" bandwidth and FM
broadcast is considered "wide" bandwidth. As you note, amateur NBFM
is much narrower at 5 kHz deviation. SNR will be severely degraded if
you try to receive NBFM with either a MBFM or WBFM receiver.

Peter S. Rabinowitz wrote:
>
> Wow, this post generated more response than my first which asked for any good
> book recommendations (of which I received very few).

Not sure if you're looking for book recommendations on PSpice in
particular (not my bag, hopefully someone else can provide some good
pointers) or analog/RF work in general. Assuming the latter...

...a late-model ARRL Handbook is a pretty good place to start, really.
One of the things you didn't specify in your original post was how much
hands-on experience and theoretical familiarity you already have with
analog and RF electronics. The Handbook will help fill in the gaps in
your knowledge, with a good emphasis on practical techniques as well.
(After all, despite the many detractors my original reply seemed to
garner, this *is* rec.radio.amateur.homebrew, not
rec.radio.amateur.simulation. :)
The '98 edition is at http://www.amazon.com/exec/obidos/ISBN=0872591786.

Once you have mastered the basics of high-frequency work, THEN it may be
time to investigate simulation tools. But do yourself a favor... buy a
good VOM and scope first. Using the sim tools to learn the basics is a
good way to deprive yourself of what many people find to be the most
pleasurable part of the learning process, and it's also a good way to
fool yourself into thinking you're more skilled at getting things done
with electronics than you actually are.

You might check out Horowitz & Hill's "Art of Electronics" as well.
They have a great lab manual that goes along with their textbook, which
contains plenty of exercises that you can work through in either a
simulator or "real life." The textbook is at
http://www.amazon.com/exec/obidos/ISBN=0521370957
while the lab workbook is at
http://www.amazon.com/exec/obidos/ISBN=0521377099.

Whatever other books you buy, you've gotta add Bob Pease's
"Troubleshooting Analog Circuits" to your list. This is at
http://www.amazon.com/exec/obidos/ISBN=0750694998.
Bob is a senior scientist at National Semi, and something of an
iconoclast when it comes to the simulate-everything philosophy of
circuit design. His book can keep you out of a lot of trouble, and it's
a great read besides. He is not unreasonably biased against
circuit-simulation tools, but he does despise (rightly IMHO) the current
trend towards viewing them as some sort of panacea for bad engineering
practice.

Also you should have a look at the two volumes of essays on analog
circuit design edited by Jim Williams:
http://www.amazon.com/exec/obidos/ISBN=0750695056
and http://www.amazon.com/exec/obidos/ISBN=0750696400. These are
longtime favorites of mine; I learn something every time I pick one of
them up.

Beyond that, it's hard to be too specific with other recommendations
without knowing more about what you're looking for.

>

That is exactly what you are doing when you simulate a circuit.

> I'll stick to digital circuits.
>

As Bill Sabin points out, it's *all* rational thinking. And a computer
simulator *is* useful. But (and I'll admit I'm a little surprised Bill
didn't back me up on this), there is a wide gulf between the act of
playing with FM voltage-source models in PSpice and your stated goal of
"learning to build receivers and transmitters." Your post suggested to
me that you are focusing too heavily on one aspect of the problem, to
the exclusion of others which are equally important, if not more so.

> > I don't thing the original poster was talking about joining a religious

> Drugs? Is this book really worth $150? Let me know - and thanks for a
> cool-headed, helpful response.

The ARRL Radio Designer is a software package, basically a circuit
simulator geared more towards the specific needs of ham homebrewers than
the "do-everything" Spice variants. I have not had a chance to play
with it yet, but I know it comes highly recommended by almost everyone
who's used it. Considering how much commercial tools tend to cost, $150
is not too far out of line. It may well be a better match for your
interests than a full-fledged Spice package.

>

> --
> To reply, remove the "ns." from the address. Fight spam!

Nobody took offense, because nobody here is an "anti-computer zealot,"
and you have nothing to apologize for. ;) All I am saying (and I'd like
to think I'm not *totally* alone in this opinion) is that there is a lot
of pleasure to be had in hands-on experimentation and observation. It
has never been easier to play with this stuff than it is today. Given a
little judicious shopping, you can equip your home lab with the same RF
tools and test equipment that NASA and its contractors had when the
Space Shuttle was designed, for not much more than the price of a new
YaeKenCom HF rig. Given all the unprecedented advantages available to
the modern ham homebrewer, I hate the thought of someone using a circuit
simulator program as a substitute for the enjoyment (and the pain) of
the hands-on approach.

True, noting I never said it was 'invalid' as a learning tool. Just
sub-optimal.

>
> The trick to using SPICE is to understand that it offers generally ideal
> components. Real components behave differently, particularly at RF.
> Accurate simulation requires including parasitic elements.

Right. (That being said, some of the newer, fancier sim tools do a good
job of modeling parasitics as well, even up to and including layout
characteristics. It's tough to even do professional-scale digital work
these days without it. But I don't think you can get free eval versions
of those... at least, not with all the component libraries you'd need.)

>
> Approaching RF design from a strongly empirical perspective glosses

Also true. Note that Peter might have gotten different answers to his question if he had posted it on sci.electronics.design as opposed to rec.radio.amateur.homebrew.

> effectively. SPICE isn't gospel, but it is a very powerful tool.

I agree with you, really. But I don't think you and the other respondents are really aware of the real-world economics of that "large array of test instrumentation":

Option A

Nice, modern Pentium PC with good-quality monitor: $~3000
Evaluation copy of PSpice: $0

Total cost to simulate something that might or might not actually work: $~3000

Option B

Good-quality digital VOM with E/I/R/L/C/etc. capability: $~150
Radio Shack 22-305 frequency counter, good to ~2 GHz: $80
Tektronix 485 dual-trace scope, good to 400 MHz: $~400
HP 8640B/323 signal generator, 450 kHz - 550 MHz: $~350
HP 141T/8552B/8553B/8554B spectrum analyzer, 100 kHz - 1.2 GHz: $~1200
HP 8444A tracking generator, 100 kHz - 1.2 GHz: $~400
Homebrew 3-output regulated DC power supply: $30 or less
Weller soldering iron and a pound of 60-40: $40
Assorted hand tools (pliers, cutters, screwdrivers...): $75
ARRL Handbook: $30

Total cost to build something with $250 worth of parts and try it out for real: $~3000

Ideally, of course, you'd like to have both options. And most people already have the PC. But you can see where I'm coming from, when I point out the advantages of getting one's hands dirty. If I had to

choose between the two, I'd take 'B' every time, because I *know* I can use it to produce something that works. If you stick with 'A', you can model the circuit and construct it, but I can just about guarantee you it won't work the first time out, and you'll end up wishing you had a bunch of the stuff under the 'B' plan to track down the problem and fix it. :-)

>Thanks.
>Jim Smith
>KQ6UV
>
Well after all the discussion on the matter, you can decide for yourself
if you want silver plating. I do know from years of experience in electrical
work that old corroded copper connections generate a lot more heat than
silver, and do more damage. In case anyone is interested, I'm posting a
summary of help I received on the matter.

1. Plating services can be found in the Yellow pages. Just be sure to get
the pure silver plating.
2. Ron Lumachi wrote an article on the subject of doing your own silver
plating in the 12/97 issue of 73 magazine. Copies available from Joyce
Sawtelle, Assistant editor, 73 Magazine, 70 N. Route 202,
Peterborough, NH 03458
3.An illustrative brochure and instruction sheet as well as supplies are
available from Texas Platers Supply
2453 W. Five Mile Pkwy, Dallas, Texas 75223
4.Cool Amp sells a white powder that you just wipe on the copper coils to
leave a silver plating. A free sample is available if you call (503)
624-6426. A one pound box costs $140.00, and covers about 6000 square
inches.

I may consider splitting a box if someone else is interested.

>Tektronix 485 dual-trace scope, good to 400 MHz: $~400
>HP 8640B/323 signal generator, 450 kHz - 550 MHz: $~350

Now if only you'd be kind enough to inform me where I can buy these two for the listed price? I have yet to see a 400 MHz scope for under $1000 CDN, and while I haven't looked for a sig. gen., I'd imagine the situation would be similar. I *have* seen GenRad sig. gens. (50-500 MHz) for $60, but I would imagine these are quite old/obsolete/hard to find parts for 'cause my college has a bunch in the electronics labs, and they have *no* equipment < 30 yrs. old for students to touch.

I am, of course, looking for a reasonably reputable place to buy from. I don't expect a 5 year warranty -- but I don't want to plunk down a sizable chunk of cash on something that hasn't worked in 20 years, and has half the parts missing.

> price? I have yet to see a 400 MHz scope for under $1000 CDN,

Have a look through http://www.dejanews.com. I've seen a couple of supposedly-working 485s for sale for aruond $450-$485 in the past couple of weeks alone, which isn't a bad deal at all as long as the seller will take it back if it fails to live up to its billing.

I bought my 485 several years ago from a guy on Compuserve for about $300, with two brand-new Tektronix probes. It had a bad transistor that was keeping the fastest 2 or 3 sweep ranges from working. $300 for the scope, plus a $40 manual, 2 or 3 hours' troubleshooting, and a $0.19 2N2222 from the junk box, got me a really nice scope which I still use all the time.

Caveat: I don't know what this stuff goes for in terms of Canadian dollars. Your mileage may vary.

> and while I haven't
> looked for a sig. gen., I'd imagine the situation would be similar. I *have* seen
> GenRad sig. gens. (50-500 MHz) for $60, but I would imagine these are quite
> old/obsolete/hard to find parts for 'cause my college has a bunch in the electronics
> labs, and they have *no* equipment < 30 yrs. old for students to touch.

The 8640B is a really nice generator; not familiar with the General Radio model you mentioned but it's safe to say it's not in the 8640B's league. (Still, heck, for $60 I'm sure you could do a lot worse.)

Civilian-model 8640Bs in good condition with the FLL stabilizer feature still seem to be around $750 minimum, from what I've seen. But the option 323 military version can often be found in the States (hamfests, Usenet...) for $350 or so. The military version is heavy, comes in a revolting yellow packing case, and lacks the FLL option. But... you can always run it outside the case, and the FLL option isn't really very important as the 8640B is extremely stable without it. A great piece of gear for the money, either way.

>
> I am, of course, looking for a reasonably reputable place to buy from. I don't expect

> a 5 year warranty -- but I don't want to plunk down a sizable chunk of cash on
> something that hasn't worked in 20 years, and has half the parts missing.

Obviously there are plenty of horror stories out there, especially when buying sight-unseen on Usenet. Nevertheless, the *real* bargains lie in deliberately buying "broken" test equipment and fixing it up. The 485 I bought was a good case in point; it would've cost me $1,000 at the time to buy a fully-operational model. I got a similar deal on my civilian-model 8640B. It helps to make friends with some of the dealers and hobbyists in your area who can keep an eye out for good deals on not-too-badly-broken equipment.

In general, given the superb quality of HP's and Tek's service manuals, almost anyone who is skilled enough to make use of this type of gear in the first place is likely to be able to fix it up and keep it running. So the value of paying extra $$$ for warranties, service plans, etc. is very questionable for the technically-inclined amateur who is looking to outfit a homebrewing test bench.

CAD tools are a boon. Not a panacea, but definately a leap forward. Modeling from real-world components is slow and expensive. For both the beginner and the professional RF designer, PSpice and other more friendly tools like Circuit Maker or Electronics Workbench are an excellent way of working out a "first-draft" of a circuit. True, the output of these programs will be a bit skewed, but accurate enough to remove the most glaring design flaws before first prototype construction. With that in mind, they are useful, time and money savers. No one is advocating the disuse of flight simulators by pilots are they?

True, though you may not be very popular running FM there - it's a
popular AM frequency. Most 6m types tell me 52.525 is by far the best
choice for FM if one will only have one frequency. Isn't most other
6m FM activity above 51MHz?

I've been using the powder method for many years. I make up the compound
myself.
It's an old formula, perhaps not what CoolAmp is selling, but it works quite
well.
1 part by weight of silver choride, 3 parts sodium chloride (table salt) and 2
parts
of cream of tartar (baking section of your supermarket). Silver nitrate or
silver acetate can be used. Proportions aren't critical.

The easiest way to apply it is to rub it on clean wire with wet paper toweling
before winding the coil. Rub it on until you can't see any copper tinge.

I have tank coils I made this way over 20 years ago in use in a linear amp .
They
still look new and shiny.

I am building a sweep generator that goes from 400 to 500 Mhz. I have it going and by putting 3-8 volts on the varicap it will swing from 400-500. now I need a sawtooth, triangle or ramp voltage on the varicap. I found a ECG chip thay said that it generated the signal but I can not find any circuit to go with the chip. If you have a simple plan for a function generator I could real use it.

Enough about 50.4... I've noticed a litte too much activity of various types down there(or at least discussions of it on the internet,I don't have any 6m stuff setup yet), so I'm just going to try something up higher. But the 49Mc-6m conversion will have to wait a while, I've started on a REALLY crazy project... Anyone ever build a nice little 2m radio? PLL tuning, DTMF and PL encoders, at least 20-30W min output(I want more power than tmy TH-205 gives me, I just can't hit those far away repeaters...)... But anyways, does anyone know where I can find info on the CTCSS encoders? I can't seem to find anything. Where does it go in there? Does it feed into the audio amp like with a DTMF encoder? Who makes CTCSS encoders? All I can find is stuff to put in commercial radios, I want something a little different... Anyways, I just found a GREAT book. Secrets of RF Design, by Joseph Carr. It'll take a while to read, but just flipping through it real quick and I fell in love with it... Ever need to know anything about making your own IF cans? And a nice section on the NE602 chip, among other things... Well, I got it from the library, but I'm going to go buy copy as soon a I get around to it...

Your colorful analogy is just that, and no more. Circuit-simulation software can be an excellent adjunct to learning about circuit behavior through books, the classroom and practical experience. Further, what we mean by "practical experience" needs qualification, because many of the effects and relationships discoverable only (or mainly) through practical experience require *considerable, well-applied instrumentation* in addition to an intelligent, alert and agile mind. The idea that merely assembling electronic gear *necessarily* leads more swiftly than time with good books and a good circuit simulator to knowledge of the behavior of electronics and RF circuitry is a fallacy.

Why not *help* the learner on his chosen path instead of slapping down his approach because it differs from yours?

The high voltage will definitely cause some problems with light bulbs, filaments, and any other "heat generating" resistive loads. I work for a large power company and this is a common problem that can be rectified, fixed not the DC kind. Either the tap on the transformer feeding your group of houses is set incorrectly, or in some cases the high voltage line into your transformer is high. This can be caused way back down the road where the HV transformer was changed in bygone times. There could also be other problems such as leaking neutral or poor grounding. I'd check to be sure both sides to neutral are the same voltage, as well as both sides to grd and lastly neutral to grd. Generally speaking the power company will check and fix a problem such as this. Good luck! In article <6jpshjnai1@gte2.gte.net>, "ss" <s@gg.com> wrote:

Perhaps you should try different types of transparency film ?

Some films are suitable for drawing on and totally unsuited

for laser printers and copiers.

Are you sure the film is the right side up in the printer box?

Some films have only one side which is printable.

I've never made my own board but I have fought with copiers and printers in my time!

True enough. It really doesn't happen all that often, though. You can
always look up a seller on DejaNews to see if they have been doing
business for awhile without a lot of negative feedback, or OTOH if there
are dozens of people complaining about being ripped off by them. When a
dishonest buyer or seller does pop up on the net, plenty of very
explicit complaints can usually be found on rec.radio.swap. It's a lot
safer than buying a used car.

Yep, you can still get 'em from places like Alltronics and Antique
Electronic Supply. For the most part, it's probably better to avoid
tube-based gear anyway. None of the gear I mentioned earlier uses any
tubes at all except CRTs, which when you're talking HP and Tek generally
do NOT go bad unless physically broken or abused.

> The second problem is that of calibration. A reasonably accurate standard can cost
> more than the equipment itself! Personally, I have access to fairly sophisticated

> people can't. And having someone else calibrate equipment can cost $200 and up.

Again, though, sticking to the 'A'-tier test equipment vendors will keep
you out of trouble. As a rule the solid-state Tek scopes do not just
"drift" out of calibration, unless something is wrong with them, and
even then they're not hard to put back in order. Calibrate the
amplitude with a known voltage source; calibrate the sweep frequency
with a signal generator or function generator. You're dealing with 3-5%
tolerances anyway, which are not hard to achieve. Similarly, there is
nothing in, say, an 8640B signal generator that is going to go "out of
calibration." The frequency display is crystal controlled, and as long
as the attenuator isn't blown, it's almost certain to be right on the
money. Remember that you don't need NIST-traceable calibration in a
home workshop. Buy good gear to begin with and you will seldom need to
give calibration a second thought.

I'm not sure what you mean by "wrong". You need the presence of
oxidizing agents to oxidize silver, and I guess my shack is relatively
free of them.

If you're referring to the usual "blue-black" tarnish, that's usually a
result of exposure to sulfur-containing compounds, solid or gaseous.
The result of such exposure is oxidation of the surface to silver
sulfide. I'm told that brownish silver oxide can also form due to
presence of ozone, but I don't know that I've ever seen it.

The people at Cool Amp tell me the product works on copper, brass, and bronze. Their response time is very good. I already received my free sample yesterday. I'm not sure about the ones you mix yourself. I'm guessing they would work on brass.

That's what the book "RF Circuit Design" by Chris Bowick is about.
It's currently being published by Newnes/Butterworth-Heinemann (who
picked up a lot of the old Sams titles).

I am wanting my own transceiver. Does anyone know the formulas for calculating components to match impedances between amplifier circuits? I have asked several electrical engineers, and they have given me some information about audio and/or DC amplifiers but nothing about RF amplifiers. Any help would be greatly appreciated.

21.7 would be a bit close to the 15 meter band. If I were willing to sacrifice some image rejection on that band I would sure look for something like that. Yes, I will be relying heavily on the 2nd IF... the first IF will be mainly for preventing reception of signals ABOVE th first IF, and keeping strong signals on other freqs from overloading the RX. It need not be particularly narrow... in fact, I want at least 6 kHz bandwidth to allow hassle-free SWLing, and I can maybe live with 10 or 12 kHz.

>A couple of years ago, I bought an old style cellular phone at a church

>them, there is the reality of building the local oscillator that starts
>up in that range and I guess I'm not quite prepared to start that.
>Something a bit lower, especially when trying to build something
>comparatively simple, seems like a better choice.
Eventually I will use a homebrew or kit DDS, but to begin with I will mix a Colpitts VFO with a crystal oscillator and use a doubler or tripler or a chain of them. A nice DDS is quite a project in itself, and the closest I have ever come to that was a good running start at a PLL.

>
>I've wondered about helicals or small cavities in the first IF, but
>again you have to use a fairly high first IF if you want something
>reasonably small.
Yeh... I want to stay close to familiar ground as much as possible since this project is so much more complicated than everything else I have built. I definitely don't want to go above or much above 30 MHz first IF, and a cavity would be pretty big HI HI.
>
>If you're thinking of using an LC filter in the first IF, unless you
>are prepared to cascade a number of tuned circuits, you may be better off
>with an FM filter at 21.4MHz.
Yeh I will look for something like that. Actually, I was seriously thinking about going with LC filtering, with a LOT of poles and a couple of modest amps scattered in amongst it, but it sure would be nice to have some decent skirts on that first passband. I wonder if a tiny bit of positive feedback from the end of the filter back into the front of it, sort of like the old Q multiplier scheme or a regen well below the point of oscillation would tighten things up without causing new problems. This is all pretty far afield, tho, and I would like to use some type of xtal filter if possble, preferably between 26 and 30 MHz.

>I don't know about the regenerative detector, but I think one of the

>
> Michael VE2BVW
Yeah I definitely am going with a modular approach, because I will be trying a detector that I may or may not have success with, and I will definitely be upgrading to a more high-tech LO when I have the rest of the set percolating properly. Might add a synchronous detector later for AM SW RX. When finished, this set will definitely be a small collection of boxes rather than one box with a nice neat operating panel. I'll worry about streamlined packaging with the Mk II version. Don't hold your breath though... I suspect this project will take me about a year to complete to my satisfaction.

Thanks again for the tip abt the cell phone IF filters. I will look into that.

Saw an article in QST a few years ago about using an ordinary photostactic copy of the artwork, and depositing the toner on the PC board with a hot iron. I tried it and got poor esults. But... with the image oriented correctly as viewed from the copper side, you can stick the copy to the pc board and use it for a drilling guide. I scan the image, reverse it if necessary,and print it on the old BJC-70. I use that for a drilling template, drilling right through thepaper. Then, referring to the artwork, I freehand the copper traces with a Sharpie marker, which makes a fairly decent etch resist pen. I don't like the rub-on transfers. A bottle of fingernail polish comes in handy for large areas, and for making sure the holes are properly filled in. If you don't fill in those holes, you might have a problem with the edges of the copper cladding getting eaten away from the holes.

Before dunking that sucker in the old Ferric Chloride, also known as "that yucky brown crap", give it a last good going over. Make sure there are no etch resist brdges between traces. If you got one, just make a nice bold scratch between them with something sharp. After etching, raid the XYL's dresser again for some nail polish remover and take off all the ink and polish. There ya go... one PCB. I've done quite a few small boards this way.

There is one good use for the rub-on transfrs... I sometimes use them for IC pads. Instead of drilling first, I rub the transfer on, then freehand the traces to the IC, and drill the IC pin holes after etching. The holes in the pads make barely perceptible dimples that make drilling easier.

As far as the photoresist method goes, I have never tried it. Looks like a lot of expense and hassle to me.

WIND YOUR OWN WITH TOROID

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining custom phenolic cores from plastic, teflon, wood, ect...

Yes, CTCSS encoders are basically similar to DTMF with two exceptions:
the frequency is much lower, and the tones are continuously present
rather than being keyed on/off with buttons. You do have to take a
bit more care about where in the transmitter you inject the audio.
Some transmitters include a high-pass filter which will filter out the
CTCSS tones. Your best bet is to inject the CTCSS right at the
modulator.

The tone is just a low-frequency, stable, sine wave. It needs to be
of fairly low distortion, as otherwise harmonics of the CTCSS tone
will fall in the audio passband & cause nasty buzzes the other guy
won't want to listen to! I've used a 555 feeding a brute-force L/C
pi-network filter. There's a lot of insertion loss - but with a 555,
there's also plenty of audio, you can afford to lose a lot! There
are, however, better ways of doing it..

BTW, going back to the 49MHz question, note that 49x3=147... you
could take that 49MHz transmitter, drive a tripler with it, and you'd
be on 2 meters...

Source record: 82499

I use this technique all the time, with moderately successful results,

even for DIP circuit packages. Note that not all photocopiers are the same. With some, I've had absolutely worthless results. With others, I've had decent results. The best seems to be a certain Kodak copier that I have access to. Also, the board needs to be extremely well cleaned (No oxide, no dirt, no grease, no nothing except copper). You need to hit the copy with the iron, and peel it up as you remove the iron (It takes a bit of practice and about three or four hands). Then, afterwards, touch the board up with a Sharpie before etching it (The toner leaves breaks, but the Sharpie ink wicks right into the breaks to provide a clean fill/etch.).

I'd probably recommend starting with a pin-through-hole board first, and keeping the size relatively small for starters. As you gain experience, you can move up to larger boards or more complex circuits.

Good luck, and practice all of the appropriate safety practices.

5429. Need xtals for HB RX!!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-29 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <356ec3ed.258125694@news.erols.com>
Source record: 82500

I'm about half-way through my Mighty Midget RX project and am starting to get concerned about the crystals for the half lattice IF filter.

I need two rocks in the 460-465 khz range. FT-243 holders would be the best, but other casings would probably also work. 455 khz rocks in FT-243 holders would be ideal.

Lew McCoy used surplus crystals in his original version of this RX. He mentions Channels 327, 326 and 45.

Anyone out there have any crystals that could make this HB radio play?

I use the EasyPC Professional XM package from Number One Systems:

http://www.numberone.com

I get quite good results by printing the artwork 1:1 onto tracing paper
in my inkjet printer, and using this, with the print side down, with
ordinary positive resist coated boards. This technique will probably
work better with a laser printer, due to the increased density of the
image. It's nowhere near as good as a 2:1 master and reduction onto
litho film, or photoplots, but it's adequate for a lot of the stuff I do
for my own amazement. It's also very cheap!

Perhaps I should have asked that way. I'm aware of the different
bandwiths used in TV and amateur communications also mentioned by
Michael and Gary, and I see that the "conversion" will probably
turn out to be "recycling of components".
I should better have asked:
Are there any schematics for 6 meter receivers on the WWW using
parts of scrapped TV sets?

FYI, according to the listing on http://user.itl.net/~equinox/tv.html
there are band I TV transmitters in Europe with video carriers from
48.2 MHz to 62.3 MHz and some around 77 and 85 MHz. The latter seem
to use parts of the OIRT broadcast band.

Hi David--

I recently posted a request for feedback on problems I'm having with the Xerox Copy and Iron-On method (TEC, I think it's called). Turned out that the toner smeared when I copied the image to the film. I tried two different copiers with the same result; but they are the same model. One guy who responded said that's just the first hurdle--you can get smearing and/or lack of transfer when you do the heat transfer too. He's sorta talked me into trying the photo-resist method. But I think I may try another copier too. I think I may be using one that's too "good" (too fast).

As far as the package to use--I downloaded EASYTRAX from the net. I like it a lot. It's much better than using a general purpose CAD program, in my opinion. I'll send you some notes I made if you like--those which came with it were a bit sketchy.

Good luck and if you figure out how to get past this smearing thing; let me know.
(BTW-our secretary told me I better not put a transparency in the LASER Printer!

It will work on brass, but I wouldn't recommend it for its physical wear
properties. It's a very thin coating good for keeping the copper from
oxidizing. You might find the silver salts at a laboratory supply
house. If you use the nitrate, wear rubber gloves; it stains the skin
when exposed to light.

We manufacture a Frequency Inversion Descrambler in wired/tested and
kit form as well as Signal meter's for Scanners. Our Descrambler is
tunable from 2400 to 4700 Hz. SCA - Subcidiary Carrier Authorization Decoders.
Scanner Service Manuals also available. 1% tollerance service adjustments
now available for scanners.

>of weeks alone, which isn't a bad deal at all as long as the seller will
>take it back if it fails to live up to its billing.

And herein lies the problem. Buying from a dealer involves a *steep* markup -- and if you buy from an individual, there's really no saying what will happen. Most folks are reliable, honest people -- but there's always a scam artist out there who'll either ship junk, or maybe not even ship anything.

>Caveat: I don't know what this stuff goes for in terms of Canadian
>dollars. Your mileage may vary.

The current conversion rate is about $1.41 CDN/$1 US. This does make the equipment somewhat more expensive, especially on a student income.

>The 8640B is a really nice generator; not familiar with the General
>Radio model you mentioned but it's safe to say it's not in the 8640B's
>league. (Still, heck, for $60 I'm sure you could do a lot worse.)

The GenRad I was looking at was an old, very primitive signal generator. Big tuning knob on the front, and that's it -- no modulation, sweep, amplitude control, or anything. Still, sometimes that's all you need.

Stability and drift are unknown -- but I saw one demo (in a lab) of one of these being used as the LO for a TV audio receiver, so it couldn't be too bad.

One problem I have with buying one is the odd connectors that GenRad used. They're these odd, sexless coax connectors, and I haven't seen them for sale *anywhere*. Perhaps someone on the group has any idea where they could be purchased?

>Usenet...) for $350 or so. The military version is heavy, comes in a
>revolting yellow packing case, and lacks the FLL option. But... you can
>always run it outside the case, and the FLL option isn't really very
>important as the 8640B is extremely stable without it. A great piece of
>gear for the money, either way.

I have no problems with ugly equipment -- what passes for a scope for me is held together by duct tape.

I must say, though, that it's a bit harder to find military surplus stuff in Canada. There's only one store (that I know of) that sell mil. stuff in Toronto, and not too many around the country (at least from what I could find on the net). Maybe I should start going to more ham fests.

>Obviously there are plenty of horror stories out there, especially when
>buying sight-unseen on Usenet. Nevertheless, the *real* bargains lie in
>deliberately buying "broken" test equipment and fixing it up. The 485 I

Of course, there's a bit of a catch-22 here: to fix equipment, you really need some test gear; but if you're buying broken test gear in the first place...

>In general, given the superb quality of HP's and Tek's service manuals,
>almost anyone who is skilled enough to make use of this type of gear in

I agree with you here. I can find any number of places where old manuals and service manuals are available on the net.

>the first place is likely to be able to fix it up and keep it running.
>So the value of paying extra $$$ for warranties, service plans, etc. is

There's a difference between paying a bunch of money for a extended warranty, and buying something that's supposed to work, and yet doesn't.

I have two concerns about buying old, possibly broken equipment. The first is spare parts -- while the older equipment might be excellent, finding those weird vacuum tubes can be quite a chore. Does anyone still make Nuvistors? <g>.

The second problem is that of calibration. A reasonably accurate standard can cost more than the equipment itself! Personally, I have access to fairly sophisticated electronics labs at school, and I can calibrate my equipment against that. But most people can't. And having someone else calibrate equipment can cost $200 and up.

We've had generally very good results doing this. We've always used HP LaserJets (of course!), but others will probably work as well. The toner for laser printers is essentially a very fine powdered plastic like stuff that gets melted into the paper by the "fuser" - the thing that gets hot. I assume photo copiers work similarly, at least some might.

The paper is the trick to the whole thing. You need something that the toner sticks to, but not too well, so that when you get it hot with the iron, it'll come back off. The best stuff we found was from Textronix, made for one of their ink-jet type printers. It's a very high clay content paper. I don't have the Tek part number off hand. Other high clay content papers will probably work OK too. Generally these are shiny parers, like magazine paper. The Tek stuff is different though, it seems almost like it's covered with chalk.

I can probably find the Tek part number, I'll look and post it if I find it. Seems to me that it costs about $50 a reem (500 sheets). Expensive, but *way* cheaper than the $1 per sheet stuff you see in magazines.

5441. Oops! Need xtals 450-465kc

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-30 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <3570333a.76652396@news.erols.com>
Source record: 82372
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

I sent this message yesterday, but made an unfortunate typographical error. I need some cystals in the 450-465 Kc range. Here's the corrected message:

I'm about half-way through my Mighty Midget RX project and am starting to get concerned about the crystals for the half lattice IF filter.

I need two rocks in the 450-465 khz range. FT-243 holders would be the best, but other casings would probably also work. 455 khz rocks in FT-243 holders would be ideal.

Lew McCoy used surplus crystals in his original version of this RX. He mentions Channels 327, 326 and 45.

Anyone out there have any crystals that could make this HB radio play?

Well, CW isn't quite that simple. Your description of what a CW receiver does
is accurate, but the key thing to note is that the signal is *not demodulated in
the receiver*. CW is AM, and like any other AM modulation, you could envelope
detect it to recover the modulating waveform (the keying waveform), but we
generally don't do that in the receiver because the modulation would be too low
frequency to hear at the speeds we normally use. Instead we train ourselves to
understand the still modulated, but frequency translated, carrier plus sidebands
product directly. Thus the complexity of demodulation is off-loaded from the receiver
to the brain. Some machine decoders do demodulate the signal with an envelope
detector before feeding it to a decoding circuit.

>A diode detector is actually simpler for AM reception
>though... the diode only allows a current to flow one way through it, and so
>the upper parts of the RF cycle get through. The peaks essentially form the
>audio envelope. The resulting audio signal is amplified and led to a speaker.

Another way of looking at this (in the frequency domain) is that the diode acts
as a mixer, mixing the carrier with the sidebands and recovering the original
audio modulation as a product of the mixing. SSB works the same way, except
that we eliminated the carrier and one sideband during modulation, so we have
to insert a local copy of the carrier at the receiver so the diode can mix that
with the remaining sideband and recover the audio product.

If we try that with AM, the local carrier has to be the same phase as the
original carrier or the two sidebands won't resolve into the proper vector
relationships to demodulate correctly. The circuit to do that is called a
synchronous demodulator. We don't need to worry about that with SSB
because we've eliminated the other sideband at the transmission point,
so the demodulator doesn't have to recombine them to recover the
audio. That makes SSB demodulation simpler than synchronous AM
demodulation.

The reason we might bother with synchronous AM demodulation is that
it offers 3 db better SNR against a gaussian noise background than does
simple diode detection. It also can offer some resistance to multipath

selective fading via a limited form of frequency diversity.

Looking at AM demodulation in the frequency domain can avoid some
of the common misconceptions about amplitude modulation systems.
All AM demodulators are some form of mixer.

>to learning how to build radio receivers and transmitters.

I used Pspice quite a bit for DC/low-frequency to RF/over 1GHz
circuits. Just be sure that any models you use (passive and active
devices) are accurate in the frequency range of interest. Neglecting
to account for lead inductance, stray capacitance, finite power
supply/interconnect/ground impedances, etc. will often produce
erroneous and/or dissapointing results. For instance, some of
the SPICE-type software vendors offer special libraries or models
of devices (such as Intusoft).

Also be aware that when running transient (time-domain) analysis,
the simulation times can get quite long or even fail (convergence
errors) when you're simlating circuit activity with widely varying
time constants.

You might also consider looking at that circuit analysis software
I believe called ARRL designer. I haven't used it but I'm sure
others in here have.

For one thing...we have no clue who the hell you are since you are
posting from a hotmail address. So please feel free to feel ignored!
I hope someone with more money and more time finds you and sues your
sorry existence. Or even better pays you a visit with Vinnie and Tony.

So in the meantime...take notice that most software companies web
sites list known bugs BECAUSE THEY RESPECT THEIR CUSTOMERS and they
want to keep the support lines open.
All alive humans breathe, and all software has bugs. Period.

You are out of order posting a mental barf like this.
Maybe you are frustrated. maybe you are mental. maybe you are a barf
and nothing else.

Go away and don't waste my time.

Say Hi to Vinnie. (if you see him coming)

Some may work by intuition and guess work, but a good designer takes
advantage of simulation tools if they are available. Simulation tools are
a *design* aid. They are not a construction aid. They won't teach you to
solder. But simulators can aid you in evaluating candidate circuit designs.
That's pretty darn important too. If the circuit design is wrong, no amount
of skill at soldering will help.

>Drugs? Is this book really worth $150? Let me know - and thanks for a
>cool-headed, helpful response.

ARRL Radio Designer is a software package for RF small signal linear circuit
simulation. It is much more limited than a full blown Spice. It cannot model
oscillators or mixers, it knows nothing about biasing stages for different
classes of operation, it is totally out to lunch attempting to model non-linear
large signal circuit behavior, etc. But a surprising amount of the design of
any RF stage depends on linear circuit behaviors of filters, matching networks,
etc, which Radio Designer does model in a very helpful way. (But RD is very
aggrevating to use. It is very node list and command oriented.) Radio Designer
is a limited subset of Super Compact, a professional grade RF circuit simulation
product.

MicroSim's Design Lab just blows Radio Designer away (at $13,500
it should). It does it all, from schematic capture through Spice simulation
to board layout. It understands oscillators, mixers, biasing, large signal
behaviors, and much more. Probe is like having an oscilloscope for testing

the circuit. You can probe the schematic, the board layout, etc, just as if there was real hardware running on the bench. A free evaluation CD limited only by the number of circuit elements it supports for a given design is available from

www.microsim.com

And get your copy quick, Orcad bought MicroSim and is discontinuing Design Lab at the end of June (IMHO this was a kill the competition deal). This is a real blow to those of us who are avid Design Lab users. Orcad's EDA is much more aggrevating to use, and lacks several important features of Design Lab.

The free evaluation version of Design Lab is sufficient for most amateur level projects. You may have to break up your project into several modules and simulate them separately, but that's rarely a serious limitation for amateur designers (highly modular designs are often a good idea anyway). Very highly recomended.

>Anyway, if anyone is using this program, I'd like to hear from you.
>Maybe you can help me get started with it? Thanks.

I use MicroSim's Design Lab. It is much more than a Spice simulator.
If you act quickly, you can get a free demo CD which has enough
capability for most amateur level design work. I just can't praise
this package enough. It is *wonderful*, and very intuitive to those
of us who started in RF circuit design before the advent of the
computer. It works the way we naturally want to work. Sadly,
Design Lab is slated to be killed at the end of June, so don't
dally, get your CD now.

For PSpice, Walter Banzhaf's "Computer-Aided Circuit Analysis Using
PSpice" is recomended.

>...a late-model ARRL Handbook is a pretty good place to start, really.

IMHO the Handbook is a *terrible* book for the aspiring RF designer. It is
too much monkey see, monkey do, and very light on design. Much better
are Wes Hayward's "Introduction to Radio Frequency Design" and Chris
Bowick's "RF Design". Both are must haves. For *receiver* design, Dr,
Rohde's "Communications Receivers, Principles & Design" would be a
good addition to your bookshelf.

>Once you have mastered the basics of high-frequency work, THEN it may be

>good way to deprive yourself of what many people find to be the most
>pleasurable part of the learning process, and it's also a good way to
>fool yourself into thinking you're more skilled at getting things done
>with electronics than you actually are.

I must strongly disagree. First build a strong theoretical foundation, then
learn shop practices. Simulation tools, along with a *good* design text,
are a very good way to quickly gain a grasp of RF circuit fundamentals.
Floundering around in the shop without a sound basic understanding
will leave you very confused, and often will give you very misleading
ideas about RF circuit design.

>You might check out Horowitz & Hill's "Art of Electronics" as well.

This is a good general electronics "hacker's guide", well worth having
on your shelf. It isn't very oriented to RF design, however. I'd add that
in lieu of the ARRL Handbook, you might be better served to have some
of the RSGB's titles on your shelf. While most of their titles are somewhat
dated, they give much better design information than will be found in the
ARRL Handbook. (They're better written too.)

>I have a GE master II PA that I'd like to convert to a stand alone brick
>amplifier. Does anyone know where I can find the modification to work the
>relay when I transmit and turn it off when in the receive mode.

It's a bit more involved than that. You'll need to add a second relay
to switch between the transmit and receive signal paths at the amplifier
input. The GE PA works with separate exciter and receiver strips, so it
doesn't need this. But if you try to use it as a "brick" amp with a transceiver,
you'll have to add it. Activating the relays can be done via a PTT signal from
the radio, or you can build a RF sensing circuit to switch the relays. The
former is better and more foolproof, but requires additional wiring to
your transceiver.

The Mastr II PA is a good one, but you want to make sure you sequence
the relays so that it doesn't receive RF drive until a load is connected
since it has no VSWR shutdown circuitry. It is also an amplifier which
requires very little drive, so you may need to add a pad to the input even
if driving it with a HT.

Hi!

like to inform the comunity that I up to building some microwavelinks -
Wouldlike to build up a usergroup around this project - If any one has
suceeded with a PCB layout I am werry intrested to share this...

I will try to make it happend so it will end up in a KIT
form.

> kc5ldn@sprintmail.com

Gary, you did not supply much information(Model #,Freq band). I'm going to guess that it is a full duplex UHF radio on one of the MED channels in the 460 range, built around the Micor series radio. The rig should tune up fine on 440 with no modification. You can order crystals and solder them into the channel elements yourself if the thing will be located in a temp controlled environment, Otherwise it will cost you about 75$ to get it crystalled up. I've replaced the crystals only on dozens of Motorola channel elements and only had problems with one, when the temp was below 0. Watch out for the duplexer, the radio is running TX on the high freq and Rx on the low freq. This is just opposite most 440 repeaters and i have seen these types of duplexers where they were not symmetrical and will not work the other way around freq. wise. You really need to scrounge up a manual at the next hamfest or here on the net before you really get started.

Hello,

I'm looking for suggestions for phase meter circuits,
it can be discrete, TTL, or all in one IC.
The specs. would be,

PHASE METER CIRCUIT
Operation: two RF inputs, A and B. The circuit
will drive a center-zero meter, with needle-full-
right for A leading B by ninety degrees, and
needle-full-left for B leading A by ninety degrees.
Frequency of operation, 500 kHz to 30 Mhz. Input
signals A and B will always be at the same frequency.

Thanks very much
for your input
Mike

Hi,

I presume you're American. Over here in the UK, we can buy RF modems i.e. transparent seriel port devices that emulate standard PC modems, but are wireless. These can have ranges ranging from in-building to over several miles. However, the technology isn't cheap, and you'd pay something like £400 for a complete long-range set-up. I reckon you could get something similar for £160 that would allow in-building communications. Take a look at www.maplins.com

Ever considered packet radio?

Mind you, I'm pretty interested in VNC too. However, facing the sheer cost wall, I'm sticking to using either IR for within the office, or a GSM modem for outside. It's so much cheaper in the short term!

Russ Sadd

5466. Best Material for Spacers???

Newsgroup: rec.radio.amateur.homebrew

Hi all
Thanks for reading this question. I hope to build folded dipoles to use on 160-80 and would like to use light plastic tubing to space the two wires, similar to the way B&W does on their dipoles. In other words, I would like to use short pieces of plastic tubing vertically placed between the two wires to keep them spaced about 8-12" apart, probably having one about every ten feet or so. I have read on several different occasions that thin wall PVC is very lossy at lower RF freqs, so my question is, what material/s do you all recommend using for the spacers?
Thanks
Rod

I had problems with our large copier, but there was a desktop version that did
a perfect job.
Ham Radio Mag some years ago published a method that worked without
blemish......

* tack film to pcb with tape.
* put on a hot plate (I used an upturned clothes iron.
* use an artist's rubber roller on the film until it begins to feel uneven.
* cool down and remove film.
There was no need to touch up even on fine tracks.
A colleague even found a better method using a plotter, he plotted on to a sheet of A4 paper using Staedtler pens, removed the paper and tacked the pcb over the same area and replotted. I saw the pcb's produced which were professional quality, coincidentally someone Stateside discovered the same method about 3 months later and I had to burst a bubble by telling him in the newsgroup that my colleague had got there first.

: right for A leading B by ninety degrees, and
: needle-full-left for B leading A by ninety degrees.
: Frequency of operation, 500 kHz to 30 Mhz. Input
: signals A and B will always be at the same frequency.

MiniCircuits probably has something you can start with for not too much money; a phase detector by another name and used a little differently is a mixer. To get what you're after, I'd run the output of the phase detector into an op-amp circuit running off of a bipolar supply.

MiniCircuits and Watkins-Johnson offer catalogs which have pretty helpful general applications information about their products besides the usual part number/performance listings.

Have fun!

Used HP 8405A's are not very expensive these days (a few hundred $.)
They go down to 1 MHz and up to 1000 MHz.

You need to be sure the sampling diodes are good in both probes. You can check them out with a signal generator. Also, you would want the adapters to coax, usually BNC. I always keep 50 ohm terminators on mine because the diodes can be zapped by careless handling.

If the hp unit is out of your price range and you want to build something, your best bet is to heterodyne the signals down to a lower frequency, say a few 10;s or 100's of kHz. If you use the same local oscillator to mix with both signals the phase information is preserved. Low frequency phase measurements can be made using limiting amplifiers to square the signal and a flip flop that sets on one rising edge and resets on the other. Avcerage the output and you've got a voltage that goes from 0 to full scale as the phase goes from zero to 180. There are fancier ways to get 360 and to get +/- 90 instead of 0-180, but this is th simplest technique I know of.

People:

I just bought a Yaesu FT-8500 mobile vhf...it doesn't quite fit comfortably in my car. I need to put the RF deck in the trunk, and use the remote feature to put the control head in my cabin.

Unfortunately, the cost of remote kits is too high...$65 for a length of cable and some connectors! Does anyone know how to build a remote cable for the FT-8500, or where I can get a non-Yaesu unit?

5477. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-31 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6kqq5k$i74@news.Hawaii.Edu>
Source record: 82408
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Sorry, my Italian is pretty bad so excuse the English reply. A good site for
HAMCOMM information, downloads, and hardware purchasing information is

http://www.accessone.com/~tmayhan/

That is the most complete site I have found for HAMCOMM. I believe schematics,
PCB layout, etc are there, and Tony himself sells a kit for a fairly well
thought-out version of the interface. Good luck!

Saturday June 6th, 1998

Annual Spring Hamfest- Fairleigh Dickinson University, Teaneck, N.J.

8:00 AM till 12:00 PM
Rain or Shine
Amateur Testing: Novice thru Extra (8:00 AM to 10:00 AM ONLY,
>>Bring both original FCC license and a photo-copy and positive ID) <<
Donation $5.00

Vendors $10.00 (per space) for a 2 parking space wide area. No
electricity. You supply tables, etc.

XYL & Harmonics FREE
Lots of Parking
Rest Room Facilities
Refreshments
Talk-in on 146.19/79

Check out http://www.BARA.org for more info

Take a look at:
http://www.dynaart.com/

They have about the best system I've tried, uses laser printer toner
and 'Toner Transfer Sheets' (avail from Mouser, Digi-Key, etc). I
use their 'Super Fuser'/laminator and get results good enough for
hobby or prototyping after etching in sodium persulfate (or ammonium
persulfate). I haven't touched the brown crud (ferric whatever) in
at least five years.

Hi Gary,

Recently I purchased a copy of the "Communications Handbook" from
RSGB's booth at Dayton. Their handbook has a broader, more
comprehensive technical treatment of receivers, transmitters, antennas,
etc; than does the ARRL handbook. I think it is an excellent handbook
for hams; I wish I had obtained one years ago.

>

Not so.

Oxidation is a chemical term. It refers to the removal of electrons, as
from silver when it reacts with sulfur-containing material. It may
sound strange to a non-chemist, but oxygen does not have to be involved.
The black tarnish you see on silver is silver sulfide. Silver doesn't
react readily with oxygen.

If you get tarnishing hanging out in a week, you've got an awful
polluted atmosphere.

Check a couple of chemistry books and search the web for "silver and
tarnish".

5500. Help with using op amp for voltage difference amplification

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-01 00:00:00 UTC
From: Marty Duplissey <mduplissey@lsbs.com>
Message-ID: <6kvjvp$992$1@supernews.com>
Source record: 82431

Heres the scoop. I'm building a High amperage (35-40) variable voltage power supply.
I'm using a lm723 as a basis for the regulator board. I'm using the plans from a 1987 ARRL handbook for a 24 volt 30 amp supply as starting point. I want to replace the current sense resister with a 50A .05V current shunt (26 watts seems like a hellofa lot of power to waste not to mention the heat) and use an op amp to amplify the voltage drop enough to get the .65 volt for the current sense at 35-40 amps and drive a meter for current measurement.. I have scoured for schematics to do this and maybe I'm missing something but I'm confused. Will I have to build a negative voltage supply to power it? Or can I just connect it up with the existing power and ground (Before regulation of course) and send one side into the inverting input and the other into the non-inverting and adjust the output with the feedback resistor? Any help schematics, links, books etc.. would be appreciated.

I do this all the time with laptops and my Netwave LAN. I don't know of anything similar for the Pilot, but I think Proxim has written Windows CE device drivers for their wireless LAN cards. You could use their PCMCIA card, one of the new Palm PC devices and a Compact-Flash/PCMCIA adapter. I prefer small laptops (like the Toshiba Libretto) myself.

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 Whats is L.O.S.A all about ?

I started to compile L.O.S.A because I know there are lots of great
ideas and many problems that are solved with the BASIC Stamp and the
main purpose of this list is to get an idea of what other people are
using their BASIC Stamps for and maybe get some inspiration or hints.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

Yes, this sort of thing has been done before. Remember that you'll need
lots of DAC resolution, and that the DAC system and your VCXO need to
have good enough stability to cover the short-medium term accuracy you
need. For this reason many standards labs still keep Caesium or Rubidium
standards in use and monitor them against off-air signals.

Also, there is the possibility of using GPS signals as a reference, but
care is needed to combat the effects of their deliberately spoiled
accuracy.

Cheers

5516. Re: sealed lead acid batteries

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-02 00:00:00 UTC
From: derekt@col.hp.com
Message-ID: <6l1ag3$23b$1@nonews.col.hp.com>
Source record: 82447

A good rule of thumb for a sealed lead acid battery is the maximum current for charging should not exceed 20% of the rated capacity. Therefore, for a 80 amp-hr battery the current supplied by the charger should not exceed 16 amps. For a 20 amp-hr it should not exceed 4 amps.

The next concern is the voltage of the charger. After it comes out of current limit its voltage will increase to some value. The maximum voltage that should be applied to a sealed battery is typically lower than allowed with unsealed batteries. I have seen voltage limits of 14.2 to 14.8 volts from sealed battery manufactures. A car battery charger I once had would go above 15 volts. Also note the maximum voltage will depend on how long the voltage is applied. If you plan to leave the charger attached all the time (termed a "float" charge) the voltage must be lower. Somewhere around 13.6 to 13.8 volts.

If it where my battery I would determine the manufacture and call them for the recommended chargering parameters. That way you will be able to get the maximum life from them.

I seen in a couple earlier messages, suggesting that Fair Radio Sales is alledgedly engaging in unscrupulous practices (IF I read it correctly).

Well, I've dealt with them in the past, and I have NO complaints on the service I got. Matter of fact, I had ordered several items, and sent a check with the order. Within 2 days, I not only had my order, but a refund of the money for the items not in stock any longer. That was BEFORE the new system of checking a customers check upon cashing, as is now possible. So, I can't complain. If they've since gone south, it would be a shame. But, until I have a problem, I wouldn't be afraid to order from them again.

VHF/UHF cavities for repeaters certainly degrade in Q and thus
increase in insertion-loss as they tarnish. Cleaning and re-plating
restores both the internal shine and the insertion loss to original
levels. I too have always believed that silver tarnished chiefly to
sulphide.

The best general treatment of this subject for the HF range that I have found is in the book Single-Sideband Systems and Circuits by Sabin and Schoenike. Although the subject is treated incidentally here in the chapter on power amplifiers, it is done at a level that is both technical and practical. I have made sveral very sucessful splitters and combiners for the 1 to 100 MHz range by following this book.

Also you will find good practical stuff in the motorola EB's and application notes for up to the 1KW level.

Hope this helps,

In most atmospheric environments it probably does. Silver sulphide is the black stuff (brown in very thin films). Unfortunately, as someone pointed out earlier, the process can technically be called "oxidation" even though no oxygen is involved - to the total confusion of non-chemists.

Real silver oxide is used as a coating for relay contacts, so it must have pretty good conductivity. However, that may also depend on the crystalline form of the silver oxide, so generalizations about "silver oxide" could be misleading. (Remember that graphite and diamond are both pure carbon, but one is black and the other is clear; one is a conductor and the other is not, etc.)

> (Extreme Hifi "interconnects" ought to be plated with MITHRIL(tm))

Don't encourage them - they're already charging "the price of the Shire" for copper!

Source record: 82317

Hello!

We have recently jumped into the AVR world with our new AVR-1
Programmer Package. The package includes our AVR-1 Programmer, cable
& power supply, our programming software, AVRTools from Atmel, and an
AT90S1200-16 microcontroller.

The AVR-1's features include:

* Programs 40, 20 and 8-pin AVR microcontrollers in built-in 40 pin
ZIF socket. Includes support for the AT90S1200, AT90S2313, AT90S2323,
AT90S4414, and AT90S8515. You can simply edit the configuration file
for future FLASH/EEPROM configurations.

* Programs AVR microcontrollers in-system using either programmer or
target power. Supports Atmel's 6-pin header standard.

* Program AVR's at +5V or from external Vcc.

* Parallel port driven

* 8-pin header for in-system programming or adapters

* Software upgradeable, no firmware to buy

For more details on this package please see our web page:

http://www.itutech.com/avr-1.htm

SPECIAL INTRODUCTORY PRICING - good until July 31, 1998

AVR-1 AT Package - as above - ONLY $59

AVR-1 KIT - includes pcb, software, and all components (40 pin ZIF
included) (does not include power supply, cable or AT90S1200) - ONLY
$35!

AVR-1 PCB - pcb & software only - ONLY $10

Sincerely,

Chris

FS: Hamfest stuff. Radio/TV repair shop contents.
I just bought out a Radio/TV repair shop from 50's into 70's. Would like to unload a lot of
the odds & ends quick & cheap. Everything is sold as-is. Prices listed do not include
shipping from Baltimore Md. Will ship internationally. Take a 25% DISCOUNT if the
total of your merchandise exceeds $30.00 before shipping.

TV Tuner sub box-Castle TV Tuner srvce $20.00 4#
Mono amp-Brand unknown but not hoimebrew 6V6GTP-P. 5AR4(GR Britian) $40.00 ($15.00 w/o tubes) 9#
B&K HV probeHV30 w/ inst & carry case. Ex appearance, $23.00. 3#
DC Bias/power supply "hi/lo" no volt stated w/5U4G $22.00($15.00w/o tube)7#
Power supply 300V adjustable, 350V & 6.3V. w/2 5U4GB. $30.00 ($15.00 w/o tubes) 22#
Power supply 80VDC, 6.4VAC ct, 7VAC ct,10VDC, 200VDC, 220VDC. 80 ST rect.$24.00 ($15.00 w/o tube) 18#
(SOLD- Waiting for payment. Beitman "Most often needed" TV books $3.00 ea 1.5# ea.
1962, 1963, 1964, 1965, 1965 additional, 1966, 1967, 1968, 1969, 1969 color, 1970,
1970 color)
Heathkit O'scope IO12 EX appearance(haven't found probe yet still unloading the truck)
$25.00. 22#
Wire-big spool of 5 conductor flat(Antenna rotor cable?) it's a 10" spool & probably at
least 90% full. $27.00. 17#
Wire- 10" spool 25% full. "12 anaconda w. densheath900 type trw 600v mtw oil resistant"
$12.00 7#
Resistors- mostly volt divider type used in old radio, some power type. Coffee can full 4" x
5.5". $12.00. 4#
Pots- coffee can full 5" x 6.5". New, used, wirewound, carbon. $5.00. 4#

I'll put more up later

vintel@aol.com

Second batch:
Tubes- Lot #1. Box of pull outs. I have not picked these, they are just as I brought them in
the door from this shop. You'll just have to trust me. Some I see on top-6W6GT,

6K6 GT,
5U4GA I see a few minatures but no compactrons. Box is 4" x 9" x 12".. $16.00
10#
Yokes- 25#. probably used. Sell the copper? $3.00 for the lot.
RCA & GE service notes, (about half & half) box full . Looks like all TV. The
highest date
I saw is 1957 $23.00. 10"x11" x 14" 33#
Antenna mounting hardware, 4 kits, 2 South River & 2 RCA. Appear
complete.$12.00 for
all. 15#
Grab box #1. Misc useful stuff. 10"x12"x8". No TV chs or junk like that. $2.50.
11#
Box of pots. Wire wound, power, mil spec, multi-section, single, little bit of
all types.
6"x12"x7" $12.00 15#
Box of wire. Assorted. HV, hook up, shielded twin pair. Some on spools, some
bundled.
13"x15"x10". $18.00. 16#
Box of cheater cables & other power cords. 3"x8"x9". $2.00. 5#
Hardcover books $3.00 ea "199 TV tough dogs" margolis, "Jack Darr ser clinic
2",
"pinpoint TV trouble in 10 Min", "color TV trouble Factbook" "Prac hndbk of TV
Repairs" Margolis. 2#ea

The ones he used were Jackson Bros caps, made in England. I don't know whether they're still in business or not, but I have a few that Doug gave me, could share if you only need one.

Hi fellow Hams I'm looking to sell or trade this amplifier for gear of equal value..

Subject:
Crown Amplifier
Date:
Fri, 20 Feb 1998 10:47:20 -0500
From:
CARL DOMANICO <cmd-dell@worldnet.att.net>

For Sale: Crown International PSA-2X Professional Self-Analyzing Stereo/Mono Power Amplifier....

If your looking for a Super-Powerfull,Highly Reliable, Amplifier you came to the right place.....It's a Cream Puff, Mint Condition, I'm the Original Owner. It's very Powerful, Rated at: 275 Watts RMS Per Channel into 8 Ohms...460 Watts RMS Per Channel into 4 Ohms...700 Watts RMS Per Channel into 2 Ohms. These are very conservative Ratings...more like 335 at 8 Ohms.... 640 at 4 ohms 840 at 2 Ohms...Per Channelï¿½.
It Weighs 57lbs/W Rack Handles. Dimensions: Height 7" Width 19" Depth 17 1/2"..*..I also have the Optional Balanced Input Module Installed, So in the event you want to feed the Amplifier with a Balanced Input Signal, from a Preamp or Mixer you can. Or your can just feed it with a Standard Un-Balanced Signal Bypassing the Module...It also has a Built in Cooling Fan, complete with Filter to keep Dust out...But it runs Cool Even at Power Levels that would fill an Auditorium....If your familiar with Crown International, Their Name has been Synonymous with High Quality, and High Reliability, for the Past 50 Years....I really would rather keep it than sell it...but since I've moved back into a smaller apartment...I have no room...I've already sold all my other Stereo Gear. The Amplifier is Ideal for a Super Home System, Commercial Sound System, such as a School or Church, Perfect for those who Perform Disc Jockey workï¿½
*Balanced Input Module has complete Adjustments for Compression , High and Low Filters, AGC Automatic Gain Control Threshold Adjustment, Test Tone Signal Generator 50Hz to 20KHz. Extremely useful for System Troubleshooting..
I paid $2300 New...I'm asking $1200 Firm, in Original Box, You Pay Shipping

5538. Re: Silver Plating Coils

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-03 00:00:00 UTC
From: John Fakan <usscod@en.com>
Message-ID: <3575EA18.7129B53D@en.com>
Source record: 82323

Jim,

I've been using Cool-Amp for 40 years and find it wonderful for any copper bearing metal -- including brass.

The procedure that works best for me is to use a small linen cloth that is wet and then wrung out 'till almost dry. Pick up some of the Cool-Amp on the cloth and then scrub the metal just as you would with scouring powder. This action cleans the metal surface and allows the chemical reaction to take place. The result is a mono molecular layer of silver. It will not plate any deeper because no more copper atoms will be available once the surface is completely covered with silver. It is very important to immediately wash off the surface or the silver layer will stain to an orange or yellow mottled look. I
usually just use the same piece of cloth and continue the wiping action while holding everything under running water.

The silver will be tightly bonded to the base metal and can be soldered. Any small amount of oxidation that might eventually occur is not usually a problem because silver oxide is also a good conductor, which is one of the reasons silver is commonly used for electrical contacts. If sulfur is in the area a gradual blackening can occur (silver sulfide). I will sometimes use clear acrylic spray (Krylon) to protect the bright silver surface if I am concerned about discoloration over time. It really behaves the same as silver flatware,

but you can't use abrasive methods to clean it because of the lack of any thickness of the silver layer.

Have fun!

John, KB8MU

According to the CRC Handbook of Chemistry and Physics: "Pure silver
has the highest electrical and thermal conductivity of all metals, and
possesses the lowest contact resistance. It is stable in pure air and water,
but tarnishes when exposed to ozone, hydrogen sulfide, or air containing
sulfur."

I am still trying to find values for the conductivity of the oxide(s).

HELP! I'm trying to build a specific radio from a British schematic, with no explanation. Everything is pretty clear except for the capacitor markings. I've received conflicting advice, and in looking through all my books, I'm totally confused.

The schematics use the typical 4u7, and 100p. Where I'm lost is there use of 'n'. I know that 'n' is between a micro and pico...but just exactly where? For example, a "470n". How do I convert that to micro or pico?

I haven't ordered from Fair in the last 2 months but they shipped
promptly then. There was a small part missing from the radio I
ordered and when I told Phil, he mailed it to me the next day.
Perhaps you caught an employee who was leaving employment there soon.
Call and ask for Phil (owner) and ask him what the story is.

Tim Hynde <hynde@flash.net> wrote:

: The transmitter is a simple fundamental xtal and in the final (about 1
: watt) there is a center tapped transformer, the center tap goes to the
: secondary of an audio transformer. The primary is 8 ohms (I suspect so
: that you could drive it from an off the shelf audio amp) and the
: secondary is 50 ohms. Since I've had a hard time finding one rated at
: more than 200mw or so I wonder if you could not use a different
: impedance on the secondary lets say 1k ohm vs 50 and then make the
: appropriate changes in output transformer of the final transistor.

: OR - I've seen other designs that are transformer less in the audio
: stage and just use a transistor driven by audio then connected to the
: center tap of the transformer in the final output stage. Can someone
: shed some light on this? I want to build one for 6m am but wonder what
: the options are for modulating it.

Use an audio line matching transformer. They have various taps
available. For example, Dalbani (1-800-325-2264) has an 8 ohm matching
transformer rated at 10 watts for $3.40 (part # 40-475).

5554. ? G4ZU Trigonal HF Beam ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-04 00:00:00 UTC
From: cphillips@engineer.com
Message-ID: <6l5anp$cp7$1@uuneo.neosoft.com>
Source record: 82335
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

This is *not* about the "three piece reflector" (sometimes
called trigonal or triagonal reflectors) occasionally used
on VHF/UHF beams.

In the April 1994 edition of QST (page 32), Dick Bird G4ZU/F6IDC
wrote an article about an interesting new beam design. I think
I may have an application for such a design.

But first, I'm interested if anyone has tried it. I did a
DejaNews search, and came up empty.

If anyone has any information on this design since the article
I cited, I'd like the hear about it. Thanks.

[UNSOLICITED TESTIMONIAL: I came across this article on the
ARRL 1990-1994 CD-ROM. These CD ROM sets are GREAT! Good
search function, acceptable quality black and white printed output,
but mainly, you can hold 12 years of QSTs in one hand and
do a computer search of their contents. I definitely recommend
them.]

Jackson Bros. still make variable capacitors. Maplin (www.maplin.co.uk)
sells a few of the range. They are expensive.

I have some vacuum variable capacitors for sale :

Jennings CADDN-30-0315, 3-30 pF, 15 kV, ceramic body, two mounting flanges, incl. copy of data sheet (10 pages)

Jennings GCSN-100-15s, 5-100 pF, 15 kV, glas body, two mounting flanges, incl. copy of data sheet (10 pages)

The capacitors are used but OK. Asking for 110 $ each, plus shipping. Email for details !

5557. TV "ferrite" characteristics?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-04 00:00:00 UTC
From: pmarkham@mortimer.com
Message-ID: <6l628j$gll@news3.newsguy.com>
Source record: 82338

I have made the following post to two newsgroups with no response relative to any definitive analysis of tv "ferrites" for typical amateur radio use. Is there a web, or paper published source of information, that considers such information?

I would be interested in any definitive technical analysis of tv "ferrite" use for typical amateur applications.

My original post to RFI:

To: rfi@contesting.com
Subject: It may not be ferrite; but...
Date sent: Thu, 26 Mar 1998 10:58:20 -0005

Probably nothing new, but original for me.

I use flyback transformer and deflection yoke cores from junk tvs to decouple feedlines, power supply leads, computer cables, etc. They are bulky, even from a small tv, but have worked well for me. Multiple passes of the cable are possible to achieve high isolation reactance and the power handling capabilities for brute force isolation has merit.

As for material type, technical characteristics and efficiency; it is no concern to me as the cores are free and work for my various applications.

Re deflection yokes, I strip off the plastic and wire, and save the clips or clamps that hold the halves together. I then reassemble the core assembly, using the clamp hardware or long nylon tiewraps or electrical tape. I then wrap the sharp edges with good quality tape. I wrap my flexible cable through the assembly as desired. I assemble them around my hardline, as I get them, as a stack of large 'beads" They can be used indoors and out.

My open wire fed 75 m dipole passes over the shack, some 30' above. My shunt fed tower is 3 feet away from my equipment. I operate hf, vhf and uhf with the typical 50 to 100 watt levels with no rf related gremlins in the shack. I sometimes run the legal limit on hf and operate the computer at the same time, without grief. As for most folks my rf ground system is poor but extensive cable "choking" has enabled me to operate all mode, analog and digital with virtually no grief.

They are quite effective for killing emi radiating from scr and triac controller power cords, swiching power supplies, etc. They have never failed to keep rf out of my power supplies, when all leads were choked with a core. Touch control lamp cord "choking" has been very effective. I have used them for eliminating rfi in telephones, vcrs, stereos, tvs, blah, blah, blah.

I have never checked to see how conductive they are to the typical dc and ac voltages used in the shack. You are warned!

I am sure, for those that wish to give my suggestion a whirl, there will be many happy customers, but as always, your milage may vary. Posted details of successful problem resolutions with similar or described techniques might be of value to others.

Pete/wa4hei

>FAIR RADIO SALES CO JUNE 3, 1998

REFERENCE YOUR EMAIL REGARDING YOU ORDER.

PERHAPS THE REASON FOR THE SURCHARGE WAS PRESENTED TO YOU IN THE WRONG MANNER. WE ARE CURRENTLY BEHIND MORE THAN 7 DAYS IN GETTING ORDERS OUT. WHEN A CUSTOMER WANTS AN ORDER UPS-BLUE WE UNDERSTAND THAT HE IS IN A HURRY FOR SOME REASON. HOWEVER, THAT IS NOT A REASON TO BE PUT IN FRONT OF OTHERS WHO HAVE ALREADY PLACED THEIR ORDERS WITH THE EXPECTATION THAT THEY WILL BE TAKEN CARE OF IN THEIR TURN. WE USE THE SURCHARGE TO COVER THE ADDITIONAL HANDLING NECESSARY TO TAKE THINGS OUT OF TURN. THE SURCHARGE IS 15% NOT %50.

THE SALESMAN WAS JUST TELLING YOU OF THE OPTIONS. HE COULD OF TAKEN YOUR ORDER AND HAD IT WAIT ITS TURN AND STILL SENT IT UPS BLUE, BUT THEN, HOW WOULD YOU HAVE FELT?

I UNDERSTAND YOUR FEELINGS AND UNDERSTAND THAT YOU WERE IN A HURRY. PLEASE TRY UNDERSTANDING THAT WE HAVE TO HAVE SOME WAY TO FILTER OUT THOSE WHO REALLY NEED TO PLACE A RUSH ORDER AND THOSE WHO ALWAYS WANT TO BE FIRST.

PLEASE RECONSIDER YOUR POSITION. AFTER ALL, WE DID SERVE YOU WELL FOR SOME TIME. THERE ARE ONLY A FEW WEEKS EACH YEAR THAT WE ARE JUST SO OVERWELMED THAT WE HAVE TO DO SOMETHING.

SINCERELY

PHILLIP SELLATI

5560. 1st Straw Poll: rec.radio.amateur.* reorg

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-04 00:00:00 UTC
From: Jeremy Billones <voting@clark.net>
Message-ID: <6l6jbt$8pn$1@clarknet.clark.net>
Source record: 82341
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy

(Repost. Crossposted to fewer groups, multiple times.)

FIRST CALL FOR VOTES (of 2)

Votes must be received by 23:59:59 UTC, 22 Jun 1998.

This vote is being conducted by a neutral third party. Questions
about the straw poll should be directed to the rec.radio.amateur.*
Working Group at <rra-wg@theporch.com>

Votetaker: Jeremy Billones <billones@primenet.com>

STRAW POLL Q & A

Q: Who is doing this?
Q: How may I join the rra-wg?
Q: Why are we doing this?
Q: What are we doing?
Q: More to the point, why are we "kicking over this hornet's nest?"
Q: Why do you want to change the newsgroups again?
Q: Who are you to tell us what to do with "our" newsgroup?
Q: How long ago were each of the rec.radio.amateur.* newsgroups created?
Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?
Q: Where can I obtain a copy of the original newsgroup charters?
Q: Where can I find out more information about the Usenet RFD/CFV
process?
Q: I don't want any of the newsgroups to change. What should I do?
Q: I want to go back to one single newsgroup for amateur radio on
Usenet, like we had back in the 1980's. What should I do?
Q: I support some of the newsgroups for amateur radio, but not others.
What should I do?
Q: I support the existence of a newsgroup, but disagree with its
charter. How should I vote?
Q: I would like new newsgroups to be created, what should I do?
Q: I have no opinion, what should I do?

Q: Who is doing this?

The rec.radio.amateur.* Working Group (rra-wg@theporch.com, which
initiated the last major reorganization in 1993) is the point-of-contact
for questions about this opinion poll. Principal members are Paul
W. Schleck, K3FU, and Jeffrey Herman, KH2PZ. Though not an rra-wg
member, Gary Coffman, KE4ZV, also endorses this opinion poll. this
opinion poll will be conducted by an unbiased third party from the
Usenet Volunteer Votetakers (UVV), Jeremy Billones

(billones@primenet.com).

Q: How may I join the rra-wg?

Anyone who volunteers may join the rra-wg. The rra-wg has always solicited volunteers from when it was created in 1993 (originally named rra-reorg) to draft an RFD to reorganize the rec.radio.amateur.* newsgroups (and continues to serve as an advisory group for FAQ maintainers and new newsgroup proponents). You may join the rra-wg by subscribing to its mailing list.

The automated list manager address is

listproc@theporch.com

Use this for subscribing, unsubscribing, getting archived info, getting the FAQ message, changing your address, etc.

To subscribe, send a message to this address with "subscribe rra-wg <your name>" Similarly, to unsubscribe, replace "subscribe" with "unsubscribe"

The list owner address is

listown@jackatak.theporch.com

Use this address only when there is a problem which really truly can't be resolved otherwise.

Q: Why are we doing this?

Discussion on the rec.radio.amateur.* newsgroups shows that there is a difference of opinion about the current newsgroups and their charters. Assertions on one side of the argument that the charters were voted upon by the readers have been countered with assertions on the other side that the votes took place years ago, by a very small minority of the current readership. There is also the strongly-held opinion among some that we have "too many newsgroups." The following is a sample posting from the discussion thread on rec.radio.amateur.misc that led to this opinion poll (the entire thread may be viewed at DejaNews, http://www.dejanews.com/):

Q: What are we doing?

As a preliminary (and perhaps even diverting) step to an RFD (which would be very laborious and time-consuming, and perhaps unnecessary), we will conduct a Straw Poll, or "Vote of Confidence" (similar to the vote of confidence for a Prime Minister made by British Parliament, or a non-binding resolution of the U.S. Congress). We do it Usenet-vote style (utilizing a neutral vote-taker from the UVV). During the poll, a vote is taken where a "Vote of Confidence" yeah or nay for each newsgroup, as currently constituted and chartered, is given by each voter (YES/NO/CANCEL/ABSTAIN votes are valid).

What votes mean:

YES: I support the existence of this newsgroup and its charter

NO: I disagree with this newsgroup's charter or I believe that this newsgroup's existence should be reconsidered in a future RFD/CFV

CANCEL: Delete any previous votes I made concerning this newsgroup

ABSTAIN: I have no opinion concerning this newsgroup

Each newsgroup that does not pass a vote of confidence by Usenet voting standards (2/3 and 100 vote majority of YES versus NO votes) may be referred to the Usenet newsgroup creation process where their deletion or modification (based on a rough consensus of the preceding 30 days of discussion and how much they lost in the vote of confidence) is proposed. Each newsgroup that does pass a vote of confidence will have its charter, and justification for existence, reinforced to the

readership (as the current readership voted on it).

Q: More to the point, why are we "kicking over this hornet's nest?"

Sometimes hornet's nests can get big enough that they wind up falling down anyway. As shown in the thread above, there are significant undercurrents of disagreement over the current newsgroups, their charters, and even the suggested guidelines and rules of net-etiquette that many on the newsgroups advocate. If this opinion poll shows strong agreement with current practices, then that would help reduce (though not eliminate) newsgroup arguments on the subject. If, however, this opinion poll shows strong disagreement, then it's probably better that we know that right away, and take steps to fix the current situation before it degrades any further.

Q: Why do you want to change the newsgroups again?

Only some of the proponents of this opinion poll wish to change the newsgroups. Some wish to simply have the current newsgroups and their charters reinforced. All of the proponents agree that an up-to-date opinion poll of the readership is desirable at this time. Whatever future actions will be taken will be determined by the results of this opinion poll.

Q: Who are you to tell us what to do with "our" newsgroup?

One answer is that on Usenet, no one "owns" an unmoderated newsgroup. Newsgroups are voted into existence by a democratic process to determine consensus (and lack of significant objection) for using shared network resources to support them. All of the existing rec.radio.amateur.* newsgroups passed such a vote at some time in the past, and should pass such a vote again if there is strong support for their continued existence.

Another answer is that this is just a non-binding opinion poll of the readership to determine a consensus, if any, for making changes. It would still be necessary to undertake a formal RFD/CFV process to change any Usenet newsgroup (and that was always possible, anyway).

It should also be emphasized here that no individual rec.radio.amateur.* newsgroup is being singled out. Rather, a consensus of the readership concerning ALL rec.radio.amateur.* newsgroups is being sought.

Q: How long ago were each of the rec.radio.amateur.* newsgroups created?

1972 (or possibly earlier, this date is when UCSD joined the ARPANet):

Info-Hams (original ARPANet mailing list at Simtel-20, continues today at UCSD as a gateway of rec.radio.amateur.misc)

1979:

Creation of Usenet News at Duke and UNC

early 1980's:

fa.info-hams (fa = "From ARPANet") *
net.ham-radio (pre-Kent Paul Dolan "Great Renaming") *

mid 1980's-1991:

rec.ham-radio *
rec.ham-radio.packet *
rec.ham-radio.swap *

1991 Reorganization:

rec.radio.amateur.misc
rec.radio.amateur.packet *
rec.radio.amateur.policy
rec.radio.cb
rec.radio.swap

1992/3 Addition:

rec.radio.info

1993 Reorganization:

rec.radio.amateur.antenna
rec.radio.amateur.digital.misc
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
rec.radio.amateur.misc
rec.radio.amateur.policy
rec.radio.amateur.space

1996 Additions:

rec.radio.amateur.dx
rec.radio.amateur.boatanchors

* = obsolete

Current newsgroups covered by this opinion poll, and the years
in which they were created:

rec.radio.amateur.antenna (1993)
rec.radio.amateur.boatanchors (1996)
rec.radio.amateur.digital.misc (1993)
rec.radio.amateur.dx (1996)
rec.radio.amateur.equipment (1993)
rec.radio.amateur.homebrew (1993)
rec.radio.amateur.misc (1991)
rec.radio.amateur.policy (1991)
rec.radio.amateur.space (1993)
rec.radio.info (1992/3)
rec.radio.swap (1991)

Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?

Though one level up in the rec.* hierarchy, these newsgroups are
principally used by readers of rec.radio.amateur.*, and their fates
would substantially be decided by any significant reorganization of the
rec.radio.amateur.* newsgroups. Though created by a rec.radio.amateur.*
reorganization, rec.radio.cb is not included in this opinion poll.

This announcement has been cross-posted to all rec.radio.* newsgroups
(except for rec.radio.broadcasting and rec.radio.info, which are
moderated). In addition, the following individuals were consulted prior
to this announcement (note that consultation does not necessarily
imply endorsement):

Richard Eckman, KO4MR, Proponent of rec.radio.amateur.dx
Brian Kantor, WB6CYT, Administrator of Info-Hams/Ham-* mailing list
gateways of rec.radio.amateur.* newsgroups at UCSD
Ian Kluft, KO6YQ, Proponent of 1993 rec.radio.amateur.* reorganization,
former rec.radio.amateur.* FAQ Maintainer
Jay Maynard, K5ZC, Proponent of 1991 rec.radio.amateur.* reorganization
Brian Short, K7ON, Moderator of rec.radio.info
Rick Stealey, K2XT, Proponent of rec.radio.amateur.boatanchors

Q: Where can I obtain a copy of the original newsgroup charters?

ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.info
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur-reorg
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.dx
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.boatanchors

Q: Where can I find out more information about the Usenet RFD/CFV
process?

ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Create_a_New_Usenet_Newsgroup
ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Format_and_Submit_a_New_Group
_Proposal
ftp://rtfm.mit.edu/pub/usenet/news.groups/Guidelines_on_Usenet_Newsgroup_Names

Q: I don't want any of the newsgroups to change. What should I do?

Vote "YES" for all of the existing rec.radio.amateur.* newsgroups.

Q: I want to go back to one single newsgroup for amateur radio on
Usenet, like we had back in the 1980's. What should I do?

Vote "NO" for all (or all but one) of the newsgroups.

Q: I support some of the newsgroups for amateur radio, but not others.
What should I do?

Vote "YES" for any newsgroups that you wish to remain unchanged, and
vote "NO" for any newsgroup you wish to have reconsidered in a future
RFD/CFV.

Q: I support the existence of a newsgroup, but disagree with its
charter. How should I vote?

Since this opinion poll is for both the existence of given newsgroups
AND their current charters, you should vote "NO" for that newsgroup.
Again, this is a non-binding opinion poll simply to determine if current
newsgroups should be considered for modification or deletion, not a vote
to actually modify or delete these newsgroups.

Q: I would like new newsgroups to be created, what should I do?

Creation of new newsgroups is not being considered by opinion poll. A
future RFD/CFV would have to be initiated to do this. You are, of
course, welcome to express your opinions concerning new newsgroups by
posting them to rec.radio.amateur.misc (*NOT* by E-mail to the
vote-taker).

Q: I have no opinion, what should I do?

You may wish to read the preceding 30 days of public discussion on
rec.radio.amateur.misc about this opinion poll to develop your own
opinions (go to http://www.dejanews.com/ and search for "STRAW POLL").
If, after reading the public discussion, you still remain undecided, you
may abstain from this opinion poll. You may do so informally by not
participating in it at all, or formally by explicitly voting "ABSTAIN"
for all of the newsgroups.

IMPORTANT VOTING PROCEDURE NOTES:

Standard Guidelines for voting apply. One vote per person, one account
per voter. Votes must be mailed directly from the voter to the votetaker.
Anonymous, forwarded or proxy votes are not valid. Votes mailed by
WWW/HTML/CGI forms are considered to be anonymous votes.

Vote counting is automated. Failure to follow these directions may
mean that your vote does not get counted. If you do not receive an
acknowledgment of your vote within three days contact the votetaker
about the problem. It's your responsibility to make sure your vote
is registered correctly. Duplicate votes are resolved in favor of
the most recent valid vote. Addresses and votes of all voters will
be published in the final voting results post.

HOW TO VOTE:

Extract the ballot from the CFV by deleting everything before and after
the "BEGINNING OF BALLOT" and "END OF BALLOT" lines. Don't worry about
the spacing of the columns or any quote characters (">") that your
reply inserts. Please, DO NOT send the entire CFV back to me!

Fill in the ballot as shown below. Please provide your REAL NAME and
indicate your desired vote in the appropriate locations inside the ballot.

When finished, MAIL the ballot to: < voting@clark.net >
Just "replying" to this message should work, but check the "To:" line.

Examples of how to properly indicate your vote:

```
[ YES ] example.yes.vote
[ NO ] example.no.vote
[ ABSTAIN ] example.abstention
[ CANCEL ] example.cancellation

DO NOT modify, alter or delete any information in this ballot!
If you do, the voting software will probably reject your ballot.

If these instructions are unclear, please consult the Introduction to
Usenet Voting or the Usenet Voting FAQ at http://www.iki.fi/~jpatokal/uvv.

======== BEGINNING OF BALLOT: Delete everything before this line =======
.--------------------------------------------------------------------
| 1ST STRAW POLL: rec.radio.amateur.* reorg
| Official Usenet Voting Ballot <RRSP-0001> (Do not remove this line!)
|--------------------------------------------------------------------
| Please provide your real name, or your vote may be rejected. Place
| ONLY your name (ie. do NOT include your e-mail address or any other
| information; ONLY your name) after the colon on the following line:

Voter name:

| Insert YES, NO, ABSTAIN, or CANCEL inside the brackets for each
| newsgroup listed below (do not delete the newsgroup name):

Your Vote Newsgroup

Thanks for the clarification! I'll use your advice.

My confusion comes from One published account which says,

"pF EuroMarking"
100 n10
180 n18
270 n27..."
etc.

Using the 'n' as a decimal place, gets me
totally confused. Is it common to use the n as a
decimal at the BEGINNING of a marking?

100pf = 0.10nF the n is used to show both nanofarad
and decimalpoint, because a decimat point is easier lost
that an n. just like 2.7Kohm is usually written 2K7

Hi,
Thought I'd add my $.02 worth. A couple of years ago, I posted an article
to the net discussing how to do the whole process. I used the thermal
wax transfer media from Tektronix (and still use) to make all my boards.
Since I was the media engineer that specified this media for our printers,
it was handy for me to get. The part number is 016-1183-00, but for the
home purchaser it is a little too costly at $115 for 1000 sheets. If you
go to one of our suppliers, you can purchase it in 100 sheet quanities.
I saw some at Fry's electronics awhile back. If you look at any of the
papers made for ink jet or thermal wax transfer, many will work. A good
rule of thumb is to see if the paper "coins". Take a coin out of your pocket
and rub it lightly on a corner of the page. If it leaves a mark, then
the paper has a clay coating on it. If it has a coating of clay (zinc
oxide), then it will probably make a circuit board for you. As far as
making the transfer, here are a few words of wisdom:

1) Darker is better, you can always remove material with a scribe or exacto.

2) Heat and even pressure are equally important. I use a tee shirt press.

3) If you are using a hand iron, place a piece of cloth over the paper to
help provide even pressure.

4) Let the page completely cool to the touch before trying to peel the paper
off.

5) Don't peel the paper off, soak it in HOT water (it won't melt the toner,
but will soften the paper.

6) Wet the board and paper frequently and rub off the paper with your thumb.

7) The toner will look a little "white" when you are done, this is normal, it's just the zinc oxide layer minus the paper pulp.

I've done lots of experimentation with this process, and have made lots of good looking professional quality boards. I use the same process to make front panels, add "silkscreen" parts placement overlays to my boards, and add schematics to the interior aluminum panels of my projects. I've been thinking of writing up all my stuff, and sending it into '73 or QST. I have made several surface mount boards, HF, VHF and a few microwave circuits using the same method.

I have used the blue line stuff, and it works fine, but is a little too costly at a buck-a-sheet. I have to add the disclaimer that since I work for Tektronix, that we profit from the sales of our media. I like seeing my company be successful, but I like seeing fellow Hams make circuits for themselves even more.

Thanks,
Ed Burress

Hi Mates,

Snipped:

I've been a Fair Radio customer since the middle 1950s. I usually buy a few things a year and look forward to adding another one of their catalogues to my collection although I kind of miss the dymo labels. Over these decades I have noticed one unifying force at FRS and that is frugality. This was brought home a few years ago when I asked them to send me an extra catalogue with my order. A week or so later my GRC-9 order showed up with the requested catalog enclosed.... The catalog was a recycled document as the original recipient had croaked and the post office had returned the catalogue to FRS with a big red stamp saying, "Addressee Deceased."
Perhaps with the passing of the dymo-labeled catalog FRS will be able to put out catalogs more frequently or perhaps expand their webb site to include the entire catalog as some other surplus vendors have done (Ford in Canada)
Cheers

Bob, KE6F

Hello Folks,

I have forsale a few heatsinks forsale of the following description.

Style 1

4-1/4" x 3-1/4" x 1" thick 9 fins

Style 2

5-1/8" x 2-7/8" x 1" thick 8 fins

On each of the heatsinks the fins run the length of the longer dimension. The flat (non fin side) does not have any holes cut in it except 4 small tapped screw holes used to hold the heatsink down.

1 fin has been milled down to half the height of the rest in order to allow a nut to be put on each of the 3 screws that came through 1 of the outside fins

$ 5.00 ea or best offer

plus shipping

The "nano-" prefix, like "micro-" and "pico-" is a recognised SIprefix, and is used by scientists all over the world.

I don't know why U.S. electronic engineers don't use it. Early in my career I ran into a British draughtsperson who changed all my capacitors from nanofarads to picofarads, and got the values wrong in the process, but at least I was able to give her a hard time about it.

5576. Re: Does anyone know of a source for 100pF Variable Caps...

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-05 00:00:00 UTC
From: "P.Singh" <singhpk@ix.netcom.com>
Message-ID: <3577F5A5.4D2B@ix.netcom.com>
Source record: 82266

Capacitance of any Variable Cap can be reduced by removing
a few of the variable plates by using a needle nose pliers.

So, a 250 or 365 variable cap could be modified into 100 pf.

I have even done that , at one time, with a small plastic PVC
variable cap, though this involves disassembley of the PVC cap and some
fixed plates to be removed, and the it needs to be assembled back again.

'Dans small parts' has a lot of variable caps that might interest you.

Mouser has 365, 90/120 variable PVC caps.

Fair radio sales lists similar caps in their catalog.

good luck

| Bill Sloman, Nijmegen

Bill, My only comment was the "marmalade". I use uF, nF, pF and fF
(on chip) all the time.

Of course most people aren't paying attention. Yesterday a talk-radio
host had most of Phoenix in an uproar because the "city drinking water
supply was polluted with di-hydrogen monoxide" ;-)

MFJ sells an addon board which does what you want. It's the MFJ-44
(around $19) for the 1278B. I'm not sure if this board will work with
the 1278 (non-B) or not, but there is also a MFJ-44X, which is an
external unit that will work with both, as well as other MFJ TNCs.

I believe the intention was to express the value with only three characters.
That's why it is n10 rather than 100p. Later, the convention got relaxed and
100 is used for 100p and 100n for 0.1uF.

The real confusion comes with 100 K. And it may mean: 10 pF +/- 10%
It is: 10, followed by 0 zeroes, and the (capital) K is a standard marking
for 10%.

By the way, Why isn't it picro, instead of pico? It would sound so much
better next to micro, don't you think ? ;)

Bob

Sounds like Standard Operating Procedure to me. My club just purchased a Henry Radio amplifier. They wanted it quicker than the standard 2 week wait so we had to pay a 15% expedite fee. To make that worth the money, we also paid for 2nd day air.

There were no complaints from the members and Henry kept their other customers happy. Smart business sense.

Radio Randy

i have a `86 buick park ave.I CAN NOT run a 2way in it.I tried my all
my radios.They cause the car to stall.I think it is messing with the CPU

in the car.It even stalls using my handheld 2m.I also tried a cobra
sideband 11m.No luck.Someone said to try to sheild the compter.They told

me it is under the glove box,i can't find it.So if anyone can help or
had this problem please E-mail me.
thanks,
danny

5597. Re: Silver Plating Coils

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-05 00:00:00 UTC
From: n7ws@azstarnet.com
Message-ID: <357762de.13906131@news.azstarnet.com>
Source record: 82356

I've sort of been following this thread while looking for a paper I tracked down the last time this issue came up.

The paper is:

"Radio Frequency Performance of Electroplated Finishes" by A. M. Fowler. Mr. Fowler was a contributor to some of the previous discussions and mentioned the paper, although I didn't ask for a copy of the paper since he is in VK land.

The paper was presented at the Institutes 1967 Radio and Engineering Convention in Sydney in May, 1967 and published in the Proceedings I.R.E.E. Australia, May 1970. (I guess they move kinda slow down there, being upsidedown.)

I will directly quote from the Summary.

"It is often found that silver-plating a copper conductor increases the radio frequency losses instead of reducing them as expected. The main causes of this apparent anomaly are found to be:

(a) the conductivity of an electroplated metal is normally lower than that of the pure, cast and wrought metal;

(b) the way that the current is distributed between the layers in a bi-metallic conductor;

(c) the use of unsuitable intermediate layers beneath the silver, and

(d) the use of a thick medium conductivity protective layer to prevent the silver tarnishing.

From a consideration of these various problems, it is shown that the most satisfactory low-loss finish can be produced by first plating with a high conductivity copper plate, and then following this with a very thin layer of low conductivity material to provide corrosion protection."

Mr. Fowler discusses the fact that commercial platers are, for the most part, attempting to deliver a particular surface finish (brightness, hardness, etc) and not necessially a high conductivity surface.

One interesting quote is: "The silver deposit is readily attacked by sulphides present in the atmosphere, with an increase in the contact resistance and severe discolouration. In a typical case the contact resistance of two silver-plated wires rose from 6 milliohms to 200 milliohms after two hours' exposure to hydrogen sulphide."

<kesler@eunet.yu> writes
>By the way, Why isn't it picro, instead of pico? It would sound so much
>better next to micro, don't you think ? ;)

According to popular etymology (most unreliable!), 'pico-' was derived
from the Spanish 'y pico' ('and a bit'), in the mistaken(?) idea that
'pico' was thus Spanish for 'a (tiny) bit'.

'picro-' would be from Greek '[pi][iota][kappa][rho][omicron][sigma]'
(pikros), which would mean 'bitter' or 'biting' - not very relevant.
All(?) the metric prefixes are derived form one language or another -
some not very rigorously.

I want to try some stereo cw reception. There are two methods, one uses a high pass and a low pass filter each fed to a different earphone on a headset. I have tried this and it
sounds quite effective. I now want to try a second technique known using a comb filter.
This works by delaying the sound and feeding sum and difference between delayed and undelayed into the two earphones.

This could be built in hardware, but in principle it would be easier to use a soundblaster
and a software fifo delay to prototype the system. I am looking for some template code
that can be use to read from a 16bit soundblaster, and to write out to two output ports (stereo) at the same time. Does any one have any experience with writing code to input and output to soundblaster, and please could they point me in the right direction.

Thanks

5609. Re: Using laser printer to create PC board film?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-06 00:00:00 UTC
From: gilly@camtech.net.au
Message-ID: <35797854.4199097@news.camtech.net.au>
Source record: 82292

For what its worth....here's my bit !!!

Not having access to a laser printer I have had good success designing the board on the PC then printing the design with the inkjet printer and then coping that image on a photocopier onto Over Head Projector film.

I use the same method of transfer as described in other messages on this thread ie Iron on.

I heat the board up with the iron first so that not too much heat is sinked to the board during the transfer process. The board is usually hot enough if you carefully place the OHP film on and it starts to stick .....so place it on correctly first time.

As apposed to the paper method I find it easier to remove the film while it is still hot. 80 - 90 % of the toner is left on the board if removed slowly.

If it is left to cool to peel off some of the image is brittle and may crack. requiring a "touch up" with and oil based marker pen.

I have in the past used the laser printed paper and ironed on but I found the OHP film transfers more of the toner onto the board.

It has been most satisfactory for all but the most detailed boards.

Interesting subject .... any other ideas??

I work in the ambulance service, and am designing a power control center for my car that will distribute power (using automotive-style relays) to my overhead lights, rear deck lights, high and low power radios, and EMS alert receivers, as well as an inverter and some auxillary power sockets in the trunk and back seat. I have two questions:

1) The relays I'm purchasing are rated 20amp at 28VDC. I'd assume that Ohm's law would allow me to run approx. 40amps through them at 12VDC. Am I correct, or am I asking for some melted relays?!?

2) I need, at peak periods of operation, to pull as much as 40 to 50 amps from my auto battery to my trunk, where the control modules and relays will be located. I was thinking about using one (or several) runs of 15A@125VAC lamp cord, or standard ROMEX cable. How much current does your typical ROMEX cable or your average lamp cord handle at 12VDC, as opposed to the 125VAC that they're designed for?

OK So I lied...I have one more question:

Is it better to fuse the runs at the battery, at the module (relays) or both?

Thanks!

For cable, the voltage rating and the current rating are not related. The current carrying capacity is determined by the cross section area of the wire and the voltage rating is determined by the insulation (how much voltage before it breaks down and arcs over). The same for relay contacts. Ohms law does not apply here. If the relay contacts are rated at 20 amps, 24 volts then 20 amps is the maximum, regardless of your circuit voltage. You also need to leave a little margin so I wouldn't plan on running more than about 18 amps through a relay rated for 20 amps.

According to the wire table in ARRL Handbook, #10 copper wire will safely handle 14.8 amps, so you will need four parallel runs to handle up to 59.2 amps. You also need to divide the loads so that no one relay handles more than about 18 amps. Always fuse the cable at the power source, otherwise a shorted wire could cause a fire. I recommend an 15 amp fuse on each individual wire.

You are drawing enough current here that you also need to consider the capacity of your battery and charging circuit. If you're drawing 50 amps from the added equipment plus whatever the standard vehicle equipment needs will your alternator keep up? Often a heavy duty alternator and battery (or a second battery) are installed when you start talking about this kind of load.

Hello,

We have recently purchased an estate of a silent key that was also a TV tech in the 70s. Below is a list of some of the test gear that came from that estate and is for sale. Prices do not include shipping. This equipment has NOT been tested but looks good and was apparantly working when the gentleman retired. I think we have the orignal manuals for most of this gear.

SAMS Auto radio service manual series(stack about 4' high) from #AR24 up. We have not cataloged these so there may be a book or missing in the series but a lot of books there. $75.00

AMPHENOL COLOR COMMANDER Model 860 Pattern Gen
Looks brand new. $15.00

CADRE - CRT COMMANDER Model 855
Looks new $15.00

SENCORE BAR GENERATOR, COLOR Model CG10
Looks new $15.00

CENTRAL ELECTRONICS Model RE-1 Multiphase CRT
rejuvanator $15.00

HEATHKIT Model IG-62 Bar-Dot Gen. $10.00

RCA CRYSTAL CAL./MARKER GENERATOR
Model WR89A $10.00

RCA MASTER VOLTOHMYST Model WV87B $10.00
This is the very large version that you can read from across the room

RCA VOLTOHMYST $5.00
Smaller 4" version

HEATH Model IG72 Audio Generator $5.00

Purchase the whole thing and we'll throw in some smaller test goodies and split shipping.

> > David Rea
> > Amateur Radio Operator KB2YQE

That's a lot of current. Don't count on the sheet metal and chassis to provide a proper return path to the battery. You need to create a good copper return path, sized the same as the supply side. This effectively gives you twice the cable run you thought you had. This also means twice the voltage drop (you loose the same on the return leg as you do on the supply leg).

The tables tell you what is the safe current load on a wire (so you don't melt the insulation). You still need to consider the voltage drop. For instance, #10 wire (using the ARRL table) is 0.9987 Ohms per 1000 feet. If you use the four parallel runs as suggested, then the resistance is 0.249675 ohms/1000ft, or 0.000249675 Ohms per foot. Let's assume about 25 feet from battery to trunk, so the total run is 50 feet. That yields 50* 0.000249675, or 0.01248375 Ohms. Since E=IR, Edrop = 60* 0.01248375, or 0.749 volts. If you have a 50 watt flood lamp (rated power at 12.5 volts), that means it has a hot resistance of 3.125 Ohms and a current draw of 4 amps. If your available voltage is 12.5-0.75, or 11.75 volts, you will only deliver 44.18 watts to the lamp. That's a 12% power reduction.

I think that you should put an auxillary battery in the trunk. To keep it simple, use the heavy cable from the engine battery to the aux battery. But, this setup will make the aux battery supply the larger part of the load current during peak use. The aux battery will still charge to the right level if you have some operating time with no light loads turned on (like, I assume, while the vehicle is in motion). Watch out forhydrogen gas venting of the aux battery. Vent the trunk properly, or put the aux battery in a sealed aux battery box with a PVC pipe air vent system to outside of the vehicle. Arcing relays and hydrogen gas are not a good idea.

Yes, though not British, but German, and not marmalade, but marmalade jar ;)

<kidding mode off>

Leyden jar, as the books say, was one of the first capacitors made. (about
1745), you have guessed, in Leyden. The dielectric was the glass jar and
water the inner electrode, the outer the experimenters hand, the measuring
device too :)
The hands got shocked on touching the other electrode.

When someone asks someone where the computer is they automatically say "under the glove box", but not all are there. Most Nissans are under the passenger seat. I never could find the one in my GM product. Anyway, call the local Buick dealership and ask the people in the service department where it is for your model car. The worst they can do is not tell you.

For Sale:

Alinco DJ-580T vhf/uhf HT w/tt pad
Dual Bander 2m/440

In Excellent Working Condition!

Frequency coverage: (approx)
108.00 - 139.99 mHz AM receive only
140.00 - 173.99 mHz FM receive/transmit
400.00 - 519.99 mHz FM receive/transmit
810.00 - 998.99mHz FM receive only

Includes:

standard Alinco 2M/440 antenna
Comet 14inch dual band HT antenna
Alinco EMS-8 portable microphone (with remote radio controls)
Alinco 7.2 Volt/700mAH standard battery (EBP-26N)
12 Volt/800mAH battery, 5 watts
reusable battery case for use with 6 AA batteries (same size as the
EBP-26N, approx)
Standard Alinco desk charger
User Manual

All the above for: $300.00

Thanks,

Pete, KC8ER

Assuming that the 20 amp figure is the rating of the contacts, Ohm's Law
does not apply in the way you assumed. The contact rating at 12 V is
likely to be the same as at 24 V, but if that is a problem, check with
the manufacturer.
>
>2) I need, at peak periods of operation, to pull as much as 40 to 50

>opposed to the 125VAC that they're designed for?

No, you must use cable designed for automotive use - headlamp cable in
your case. While electric power cables could be made to work, they are
not designed to be used under automotive conditions and there are
several problems that might occur.

Cable current ratings are independent of operating voltage.
>
>OK So I lied...I have one more question:
>
>Is it better to fuse the runs at the battery, at the module (relays) or
>both?

You must fuse at the battery end, so that the fuses protect the wiring
from burn-up if you get a short-circuit somewhere along the run.

Nano, "n" is right between pF and uF. So, since there are 6 powers of ten
between them, a nF is 1000pF and .001 uF, so your 470nF is .47uF !
Likewise, the conversion to pF is to multiply by 1000. So it's 470,000pF !

Why not create your own software? Demodulating the audio is dead
simple - only when you try to do automatic sync detection and stuff
does it get complex.

**** Stuff Deleted ********
If you use an iron, then by my experience, you'll do an imperfect job. I got
the perfect tip from Ham Radio Mag that ensures a perfect job each time, it
recommended using an electric hot plate, but I used an upturned clothes iron.
You tack the film to the PCB with tape, place it on the plate/iron, then use an
artist's rubber roller (from any artist supplies store) lightly on it until it
feels a bit lumpy, cool it off and when the film is peeled off, it leaves a
perfect job, even on very fine tracks.
Using an iron on top almost guarantees the tracks will spread and break in
places.....73.....G3VBV.....

Following Gary Coffman's suggestion (thanks, Gary), I brought up the
website, and ordered the CD ROM and also downloaded the Microsim
Design Lab. I received the OrCAD product in about a week. I went back
and carefully checked site again. I had ordered correctly, and it
looks like Microsim is no longer available.

I had some problems with the download, and downloaded it again
yesterday (Sunday). Microsim is still available, but it is not a
quickie download process.

It took about 1 hour and 20 minutes to complete the download, this on
Sunday morning when activity should not be very high. Typical speed

was 2.7-3.2 kb/sec.

Be sure you have plenty of free hard disk space. The downloaded file, 80dlabe.exe, took 16,086 kb. I ran this self-extracting file, and 31.7 Mb of space used, including 80dlabe. I ran Setup.exe, and got the final program, which required about 44.086 Mb, if I added correctly. A few options were offered, and I used their recommended typical one. During the process, a maximum of 44.086+31.7-16.086 = 59.7 Mb is needed, if 80dlabe is deleted after extraction.

Be careful when listing the final directory, etc. Microsim calls the program MSimEV_8, and I apparently used MSimEV-8, Anyway I ended up with two programs, the EV_8 and EV-8, with the EV-8 seeming to be an incomplete program. Annoying, since I went through the drill again to avoid this type of problem.

I ended up with an impressive list of folders and many files, and wondered what to do next. There was no obvious place to start, and no getting started file. Plenty of manuals were available for download, and I downloaded all that looked useful (skipped the autorouter, and network user's guide), and had another 19 meg's of data. I didn't order the evalset.exe since it's files were listed separately, but think I should have ordered it instead of the others. The data said the size of the evaluation set is 10.062 meg's, but this seems to be the unextracted size. So downloaded time is reduced, but much disk space is still needed.

Psched.exe seems to be the correct file to start a design simulation, and schmurgd.pdf the appropriate manual for this phase.

5644. Learning DSP ??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-08 00:00:00 UTC
From: xhduff@ica.net
Message-ID: <357c122c.0@lightning.ica.net>
Source record: 82229

What is the best way to learn DSP's ?

I understand that it *can* involve complex
math however all I really want to do at this point is to be able to
make simple filters...nothing too exotic.
I'm quite comfortable with Motorola and Intel
microcontrollers and programming them.

There are no courses at any local colleges here in Toronto
and any DSP seminars I've been to are basically
limited to your typical manufacturers' flogging
their wares...not too much valuable info on using them.

Any help appreciated.
Please reply to hduff@ica.net

>decimal at the BEGINNING of a marking?

I've only just come in on this one so someone else has probably said it already.

The markings you mention were not easy to get used to when they were introduced but they soon become second nature.

On you specific question about n as a decimal place the answer is "yes" but you will notice that the value is "padded" out to three digits to avoid ambiguity or the problem of a character missed during printing.

A component marked n1 would not be allowed (or if found should be treated with suspicion) as it could be a badly printed n15.

One of the big reasons for pushing this nomenclature is that all standard values can be expressed with just three characters. Real estate is at a premium on modern components and having enough space to print 4700pF is a luxury that no longer exists....4n7 says the same but a lot shorter.

All you need now is a corresopndent like me to practice similar brevity and all will be well. :-)

5651. Building a good,cheap QRP rig

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-08 00:00:00 UTC
From: Michael1998@webtv.net
Message-ID: <6li7kh$9b0$1@newsd-113.bryant.webtv.net>
Source record: 82236

Does anyone out there know of any good designs for a working QRP rig for either voice or CW that can be built fairly cheap (under $100) with readily available parts, that someone can build without being an electrical engineer? I am a General class ham and see stuff like this all the time in the various ham radio magazines, but I can never figure out how to build one. If anyone has any good plans for a QRP rig that will work, any band on HF will do, please e-mail jme he plans and let me know. Also, does anyone know of any good sites on the net to order QSL cardS?

Thanks
Michael Brown KD4UXW

>> According to the wire table in ARRL Handbook, #10 copper wire will safely
>> handle 14.8 amps, so you will need four parallel runs to handle up to
59.2

Believe it or not #10 copper wire will probably
handle safely a lot more than 14.8 amps.
What most people don't realize is that the wire tables
usually give the amount of current that will cause a certain
temperature rise in the wire that will shorten the life of the
wire over time. When I worked for Memorex they wanted
me to look into methods for reducing the size of a wire
harness for one of the disk drives. One of the wires was
by a previous designer a 10 awg wire used in a sort of
shutdown circuit in the event of a fault with the system.
This wire never had any current through it except in the rare
event of a fault. I thought that this wire might be a good
candidate for reduction and did some investigating.
I decided to fuse some wires and determine for myself
what the true current handling capabilities of different wires
might be. The shutdown circuit would draw about 10 amps
for about 1 tenth of a second. Well I worked my way
down to a 2 foot length of 24 awg wire running about 20
amps through it for about a minute. It got very warm almost
borderline hot but never fused at 20 amps. I settled for a
18 awg wire mainly because it would make a more reliable
connection in the terminal (spade lug).
To get a better perspective of the current handling ability
of wires,,,,, just look at the awg wire inside various fuses
Although it's not a true perspective it's close.
However I'd advise to stick to the guidelines for
"safe current" for the sake of wire life and also because
the larger wires make for better terminations and less heat
generated at the terminals.

So really current carrying ability in this case almost
becomes secondary to I*R losses for automotive it
seems.

>D) Forget transistor switching; you can't spare the voltage loss.
>You might be able to get away with big MOSFETs but I doubt it's
>worth it.

I really don't know this so I'm wondering what effect
the loss of half a volt or less will have on the operation of
a power inverter. Wouldn't the inverter have enough
range to re-regulate the voltage?
I don't understand really what he's trying to do.
He says there's a relay console in the trunk.
I don't know if he wants to switch the main power or
wether he means to switch Items independently
I'd imagine that
some of the lower current carrying relays could be replaced
with transistors,,,,, but maybe for the sake of simplicity,
maybe he should go with relays across the board.
I guess with
automotive relays they could be replaced fairly easily
when they start to screw up.
He really needs to be more specific.

Hello--
I'd use a heavy-paper carrier sheet and tape the laminate to the
carrier. Your suggestion of Sharpie markers sounds good, and it might be
possible to cut a marker to length, fit it into a used pen, and then
discard the marker after completing a layout or two-- it certainly would
cost less than photoresist!

Your neighbors still may need to install common mode chokes on their comsumer equipment. If you need to do this, get the #43 Amidon snap on cores from Byte Mark. They're about $3 each. Probably need to use them on the catv and ac inputs to the receiver and possibly the vcr as well. This should help a lot.

Hi,

I'm looking for a low phase noise and low distortion VCO circuit for
frequencies from about 500 MHz to 1GHz. A tuning range of 1:1.5 is enough.

To improve phase noise I thought of using several varicaps in parallel and
so a
circuit with only one variable capacitor would suit me best.

Thanks

Peter

> B) Fuse it at the battery.

I knew a guy who had a 800 watt linear on his CB in the trunk. He tran
a piece of welding cable to it from the battery. But no fuse at the
battery. On day his exhaust pipe got too hot and melted thru the
insulation on the wire, and it caught FIRE!

So he had to learn the hard way about fusing circuits.

Howdy,

I guess the first thing to determine is if the transmitter is desensing the receiver. Are you (or someone else) able to kerchunk the repeater from 30 miles out but not hold it? Can you disable the transmit or controller and just listen to a distant station on the repeater receiver? If so, while a distant station is being received, engage the transmitter and listen if the received signal decreases dramatically or disappears completely. If that is the case... well, that will open up a whole can of worms...

Or, is sensitivity just bad? Do you have a signal generator?

Very hard to justify hand-building something like this, considering the
great prices on the Mini-Circuits VCO line. Check out
http://www.minicircuits.com/98dg161.pdf for some examples.

I made a couple of transfers tonight, using the photocopier and hot
iron method, and I was having trouble getting the toner to transfer.
Then, out of desperation, I tried moistening the paper slightly.
I found that the transfers improved dramatically after that.
I haven't had enough experience with this to know if it'll help in all
situations (I've only made two small boards tonight), but I thought
I'd mention the tip in case anyone else wants to try it (Beware of
steam burns!).

5679. deaf ge master 2 repeater-help pls

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-09 00:00:00 UTC
From: kc5swi@flash.net
Message-ID: <357cc966.269134361@news.flash.net>
Source record: 82248
Body handling: HTML body converted to readable text

I have a ge master 2 vhf 110 watt radio converted into a repeater on 145.230/144.630.

The radio is set to output 35 watts into the wacom duplexor, up the 80' of 9913 coax, to a 5.5 db verticle cushcraft antenna. Transmit is fantastic, nearly 30 miles . However, recieve is poor at only about 10 miles using a 50 watt mobile with a high gain antenna. I can still recieve the repeater full scale when it cant hear me!

The radio was professionally tuned up on frequency and the icoms trimmed out. The nhrc internal repeater card works great.

My master 2 does not have an internal or external preamp. Should I add one?? How well does the ge internal preamp work?

I recently purchased an additional 100" of tower, a db-224 commercial style antenna, and 200" of 7/8 helix to try to resolve the poor hearing ability of the repeater. I fear it will transmit 40 miles after the improvements, but still only hear 10 miles.

I realize there is loss through the duplexor. I am running a pl tone of 110.9.

Any suggestions??

Thanks in advance for any help, please e-mail responses if possible to kc5swi@flash.net.

Source record: 82249

I wonder if there are any antenna guru's out there who may have a design for a vertical that I could use. I'm limited in what I could put up as the flat where I live have said no to a long wire or an 'array' of any description. I could put up a vertical as long as the overall height it less than 3.2 metres or about 10 feet. OK it's not much.

I can obtain a length of copper tubing of this length (15mm plumbing) which could form the basis of the antenna but I'm sure that with appropriate base or mid section coils (cutting the tube as appropriate) I could increase the effective length and efficiency of the antenna.

Does anyone have design that I could alter to fit ?

I'm on the top (of two floors) and it's a flat roof. The suggested base is going to be a 10"x10" biscuit tin filled with cement to form a sound base.

Initially it is going to be recieve only but eventually will be 100W transmit too.

Regards,

Dominic

A) Get a piece of appropriate cable. I'd say #4 or better. It's not so much the current rating you need as minimum drop; at 13.8VDC you don't have as much to lose as at 120VAC.

B) Fuse it at the battery.

C) Use a contactor at the battery. Note that most starter contactors are not rated for continuous duty. But a similar looking beast is out there; it's used for paralleling batteries in RV's etc. Try auto parts stores.

D) Forget transistor switching; you can't spare the voltage loss. You might be able to get away with big MOSFETs but I doubt it's worth it.

E) A viable option is a small second battery in the trunk and a special splitter so the alternator charges both. This also means the car still starts when you leave something on. Try the RV market for the splitter.

F) I'd be least worried about alternator capacity. Vice my 30 amp Beetle with a GE Prog line days, most cars come with lots of alternator capacity; I've seen 120amp ones!

Hello--

If I ever free up a little time, I'd like to experiment with using an HP7475 pen plotter to directly scribe patterns on PC board stock. A while ago, someone discussed using plotter pens containing a resist ink that would allow direct plotting of traces. However, the ink in question had toxic properties, and the pens weren't available in the U.S. Any suggestions as to currently-available resist inks?

Another approach would involve coating the board stock with a wax or other resist (gun bluing?), replacing the pen with a stylus, and then plotting the layout's negative. The pen would scratch away the resist, leaving conductor areas coated. This approach would probably require using a vacuum-cleaner hose to draw the resist residue away from the plotter.

Finally, Roland Corp. supposedly makes a computer-controlled milling machine PC peripheral that might serve as a direct engraver-- the commercial PC engraver machines that I've seen advertised are expensive. Does anyone have any experience with either the Roland device or engraved boards in general?

Source record: 82259

I've used an X-Y plotter to draw patterns directly onto PC board
stock. The plotter was modified so that locator pins could be
inserted through the board to hold it in a fixed location on the
plotter table. If memory serves, I think the HP7475 is a gripwheel
plotter that moves the paper to draw lines in the vertical axis
(i.e., the pen can only move horizontally). It might be difficult
to draw vertical lines on PC board stock with this kind of a plotter.

I used "Sharpie" brand permanent markers as an etch resist. (A friend
machined a pen holder out of lucite that made these compatible with
the plotter mechanism.) These pens were available in at least two
different tip sizes, providing a crude method of adjusting
trace width.

It would seem to me that since most of us have easy
access to WWV and a sound card that writing a routine
to sync the computer clock from this should be the
next step. No phone calls to the naval observatory
or the internet.

Anybody know if this has been done and where the
code is (I don't want to reinvent it)?

Sounds like a good Idea, I would be willing to try but the followin will
hinder me for the Next few weeks:

I need to look at getting QSL.NET to host the RA feed, maybe someone could
talk to AL, who runs it.
I'm gonna be on vacation the last weekend of june and July 4th Holiday, too
bad though we could have specail edition of "Liberty Net" for July 4th, I'll
have a radio but probably no tape nearby.
I don't know how fully on how use RA files, I've downloaded RA basic server
free off of the real site but need to figure it out.

Let me know your input. (I'll try to listen to 3950 at work tonite)

Sure it's not 400 Hz? 400 Hz converters shouldn't be too hard to come by on the
surplus market.

Maybe a bridge rectifier into a 400 Hz converter would work... but probably not
too efficiently. You will want to follow the bridge rectifier circuit with a
transformer I imagine.

Check your unit again and see if 400 Hz won't work.

You mght want to consider converting the radio for regular 60 Hz operation.

Michael - I would suggest you start with a CW transmitter and use a general coverage receiver or amateur transceiver for the receiver.

Later on you could add a direct conversion receiver and double sideband.

I would suggest 80 or 40m would be a good starting point. Frequency agility is highly desirable. This can be achieved by using a VXO circuit on 40m (10-20 kHz shift typical) or a 3.58 Mhz ceramic resonator on 80m.

A simple 80m CW transmitter using a ceramic resonator is described on my projects page (URL below). Cost should be about $25-30. There are links to many other designs for QRP rigs via my QRP page.

You may be surprised to hear that the UK lacks the sort of written constitution that you're used to. It was probably one contributing factor that impelled certain people to emigrate, declare independence, and write one ;-)

Hello--
FWIW, many surplus avionics carry 400-1600Hz ratings, so your 800Hz unit
might run fine at 400Hz.
If you don't want to disturb the unit's appearance by removing the 800Hz
power-supply components, consider disconnecting these internally and
running the unit from an external 60Hz-to-DC powr supply.
73,
Brad AA1IP

Lower than anything you're going to build by hand with random hunks of metal as a resonator, though.

If he is talking about a cavity oscillator, of course, he can do a lot better. But the 1.5:1 tuning range pretty much rules that out. (Even the MC VCOs on that page don't have that wide a tuning range, although they sell others that do.)

So, does this mean that Australian capacitors use *Vegemite* as a
dielectric? (It might actually work...)

Weak attempt at humor,

Curt Breneman
RPI

5709. Need info on RF generators and sputtering amps

Try going to http://www.wtt-germany.com/
to get the latest version, 4.2 of the software for the probescope. This
is the original manufacturer of the scope that Radio Shack did such a
poor job of marketing. I bought three of them at $49.95 on closeout.

Permitted voltage drop is an even more significant factor for power
cables.

>borderline hot but never fused at 20 amps.

I agree: I have done similiar experiments with twisted pairs enclosed in
plastic tube: a wire officially rated at 1 A would carry 8 A without
even becoming appreciably warm after an hour!

However, in this automotive application, voltage drop is even more
critical than for mains power wiring, so THICK cables are required.

Yes, there probably is

It's possible to process the signals in various ways to give a stereo
effect. The human ear/brain combination is pretty good at picking
signals out of noise if they appear to come from different directions.

Regards,

I hv an ancient Eico 722 VFO. the vfo and buffer amp tubes are missing,
and i do not recall their type, tho they have the classic 7BK basing.

the 6AU6 and 6BA6 are pentodes, but not the same kind (sharp cutoff vs
remote cutoff).

which is preferable for a vfo osc and buffer amp?

thanks...

What do you need exactly? There are cheaper sources (Rallies etc) and
there could be someone coming to VE land.

Hello!

We've just updated our Technical Bookstore that focuses on titles
relating to all areas of electronics -- including robotics,
microcontrollers, radio and more. We are trying to find books that
are outstanding in their field, not listing every title available.

We are looking for recommendations for additions to our bookstore. If
you have any suggestions please e-mail them to books@itutech.com and
we will review your suggestions.

Please see our bookstore at http://www.itutech.com/techbooks.htm

Thanks!

5730. CMOS Super Keyer III problem

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-11 00:00:00 UTC
From: artky1k@northlandlink.com
Message-ID: <357fee0f.425311@news.tds.net>
Source record: 82165

Hi Everyone,

I've recommended the CMOS Super Keyer III to many of you, and more than a
few of you has built it and use it daily. I love mine, there is nothing
else that even comes close to it!

I wanted to move mine to a smaller enclosure and increase the portability
after having found a source of SSSMMMAAAALLLLL 50 k pots and a piezo buzzer
that is less than .5 inch diameter and 3/8 inch deep.

I built the unit in a small box and will mount that box on my bencher
paddle after relocating the post that holds the return spring.

By using these small components, and some sub mini pushbutton switches, I
have reduced the current drawn from 40 ma to 8 ma and the entire assy
(except batteries) fits in a box that is 1.75" by 2.625" by 3/4".

The problem came when attempting to use the piezo buzzer however! The chip
is set up to drive a speaker with 500 to 990 hz user selectable square
waves. This makes a wonderfully nice sounding monitor, but small speakers
are not available.

If the user is willing to settle for a 3.3 hz fixed tone, the piezo buzzers
provide more than room filling volume (much louder than the speaker was),
and they draw 8 times less current than the speaker. The piezo buzzer is
the key to making the circuit small and portable--using the piezo buzzer
instead of the speaker even allows smaller batteries to be used because the
peak current drawn is much less!

I've operated cw exclusively for the past 26 years, and I've never been
hindered by the fact that the monitor sidetone was not 700 hz! My original
CMOS Super Keyer used a piezo buzzer @ 2.9 khz. While a 700 hz tone

might
be nice, it should be an option for those who elect to use a speaker,
NOT
MANDATORY. I'd rather have the OPTION for a piezo buzzer.

There are at least 10 available IO ports on the motorola chip used in
the
super keyer III, but none of them has a logic output suitable for
driving
the piezo buzzer!

I called one of the authors of the firmware for the super keyer III
and he
confirmed that an output suitable for driving a piezo buzzer is not
available. There is no firmware command for converting the existing
speaker
output to a piezo buzzer capable output either!

Needless to say, a 3.3 khz buzzer driven by a 700 hz square wave
SOUNDS
LIKE (expletive deleted).

A one shot monostable vibrator could be added to lengthen out the 700
hz
pulses, or an rc circuit could be used. I find it very disturbing that
such
a fine keyer is lacking this option!

The author of the firmware was very nice and I demonstrated the piezo
buzzer over the phone. But, he advised that he doesn't own the
software and
that he was only paid to write it and that he has no other interest in
the
project. He is unable to modify the software and provide an updated
chip, I
even offered to PAY him to do this for me. He also advised me that
Idiom
Press is owned by a businessman (non-ham?), and that an appeal to them
would be unsuccessful. Ever notice that ads for the Super Keyer DO NOT
list
a phone number for Idiom Press?

Does anyone have any suggestions regarding this problem?

Personally, I'd like to see a surface mount version with more
features. The
piezo buzzer and the volume control would be pc board mounted! Both
chips
used in the super keyer III are available in smt packages and the
entire
circuit (including pot, piezo buzzer and memory channel switches could
easily fit on a 1.5 inch by 2 inch pcb)!

Does anyone have any pull with Idiom Press?

GL

Art...

posted to internet, copies sent to N0II, KC0Q and Idiom Press.

5731. battery sucked dry

Newsgroup: rec.radio.amateur.homebrew

From: drmarc@wwa.com
Message-ID: <6lotmggii1@hirame.wwa.com>
Source record: 82166

I have a Kenwood TR-7800 --- which is an old 2-meter mobil rig originally built with max of 25 watts.

It has Ni-Cad batteries for memory backup so the rig could be taken from car to car or car to house and not lose the channels in memory. There is a cub - power sourse to keep the batteries charged so if the rig is not used for several days the batteries will still be full charged.

Problem:

I use this rig as a base unit and thus is powered by a PS. If the rig switch is left on and the PS is turned off the bleeder resister draws off all of the charge of the memory batteries. I would like to build in a system to prevent that from happening. Would it be a junction diode? Would I put it in only the hot line and not the ground line leading to the rig???

Any help appreciated.

One way that has been around for a long time is to assign
left-to-right locations by audio frequency, so that CW signals on
different frequencies appear to come from different locations in
front of you. You can then concentrate on the one you want (the
cocktail party effect) and ignore the others.

DSP (soundcard or otherwise) would seem to be overkill for this.
I'd use a couple of op amps. Your mileage may vary.

Don't forget that soundcard APIs are operating system dependent,
and (despite the efforts of the folks in Redmond), the entire
world doesn't run one operating system. On my home system the
soundcard is /dev/dsp, and you use all the usual operating
system calls to talk to it (open(), close(), read(), write(),
ioctl()). The hardware is Intel, but the OS is Linux...

Hello,

I've done business with Fair radio on many occasions over the past 10 or 15 years and found their customer service to be, well, there isn't any. Their business mechanism seems to be straight out of the stone ages. I have asked them very simple questions regarding their stock and have been TOLD to, "write us a letter with your requested information and we'll write you back". I don't think so!!! Many of the guys there act as though they are doing you a favor by answering questions about the equipment you're interested in buying. It's obvious, they just don't care. Consequently, I've been doing business with other sources and have been well satisfied.

Hell, even if they're not particularly interested in doing business, they should at least act like it once in a while. Who knows, they might even obtain a sale through basic customer service. Pfffffffttt.

Good luck,

Peter

A series diode (of suitable current rating) in the positive supply lead
will prevent reverse current. There will be from 0.6 to 1+ volt drop
across the diode which will not likely affect the Rx, but will reduce
the Tx power somewhat. The PS voltage could be cranked up to
compensate. A shottky(sp) barrier diode will lower the aformentioned
voltage drop.

Hello!

I have connected my FT747GX to the web.
The solution is a java applet and a real audio server, providing both tuning controls and live audio.
The FT747GX can be digitally tuned between 100 kc and 30 Mc in 100 kc steps.

Geographical location is 15 kms south of Stockholm City, Sweden. Aerial: dipole.

Welcome to http://hightech.lindman.com

Best Regards

5741. UHF Oscillator

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-12 00:00:00 UTC
From: jos <soj@sympatico.ca>
Message-ID: <35807E3D.54E8@sympatico.ca>
Source record: 82176

If you can tolerate having a mechanical tuning system plus veractor tuning for PLL, I would suggest using a UHF television Tuner. I use this in an
instrument which measures group delay and the phase noise must be very low. After trying many Octave VCO's 500 to 1000 Mhz, I am still with the old mechanical tuner. On the north american UHF tuner, the oscillator goes up to 931 Mhz (Channel 83). I install a miniature coaxial connector and a small pick-up loop followed by an external 20 db amplifier to raise the level to +7 Dbm for mixing into a diode mixer. The overall phase noise is very low, but suffers from other type of noises, like mechanical vibrations. Regards!

5742. Phase meter.

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-12 00:00:00 UTC
From: jos <soj@sympatico.ca>
Message-ID: <358081C8.248E@sympatico.ca>
Source record: 82177

You can make yourself a phase meter using a VHF limiter like the Motorola MC13500 (one in each branch A & B) followed by a VHF phase detector like the MC12040 which can operate to 80 Mhz. Analog Devices also have Limiters and Phase detectors. The MC12040 has a range of plus minus 2 pi radians. Regards!

Would appreciate a line on some of the other places you have found that
have a large inventory of electronic surplus, similar to Fair. The ones
I know of are IG Ford in Canada and Nebraska Surplus Sales. Know any
other good ones?

I have tried the hi-pass, low-pass filter approach, but only with a relatively crude filter, and there is clearly a useful effect. The comb filter has a subtly different effect. If you set the delay to a relatively long period, you get a frequency aliasing effect that overlays the audio spectrum across the apparent sound field many times. Now at first sight this may seem less useful than the single span, however there is a very important effect called masking which I am hoping to explore.

I could build one of these systems in hardware, but prototyping it using a soundblaster may be a better (and more flexible) approach to experiment with.

Hi &#65533;

I am looking for a power regulator chip "MC1469". It was used as a control circuit in a 400W power supply (1984) and don't want to replace
the whole unit.

I will really appreciate it if you could tell me whare to find two (one
as a future spare) of these regulators.

Please e-mail me for I don't always read news-groups.

Regards &#65533; Kobus

Circuits and design info can be found in "Single Sideband Circuits
and Systems" Sabin and Schoenike.

This is an excellent book, by folk at Collins Radio. The section on RF
preselectors is the best coverage I've seen.

Cheers

From: Al Dolgosh <al.dolgosh@hamradio.org>
Message-ID: <3581102B.56B0@hamradio.org>
Source record: 82184

For Sale:

Matched set of two new panel meters - ideal for the homebrew builder.
These are high quality Weston meters I got for a project I never built.

0-50 ma DC
0-200 ma DC

These modern panel meters are rectangular - 3-1/2" wide by 3" high - and
can be mounted in a 2-3/4" round meter hole. Additionally, each meter
has an optional Weston escutcheon kit, which allows it to be mounted in
a 3-5/8" by 2-1/8" rectangular hole.

I will both as a set for $20.00 plus shipping from 44134.

For Sale:

Matched set of four matched new panel meters - ideal for the homebrew builder. These are high quality LFE/API taut band meters I got for an amplifier project I never built.

(Filament) 0-10 volts AC
(Control Grid) 0-50 ma DC
(Screen Grid) 0-100 ma DC
(High Voltage) 0-8 Kilovolts DC (1 ma movement - requires 8 megohm multiplier)

They are not marked with "Filament", etc. - this is what I intended to use them for. I never got a plate current meter.

These panel meters are modern rectangular - 2-3/4" wide by 2-3/8" high - and mount in a 2-1/8" to 2-1/4" round meter hole.

I would like to sell only as a set for $40.00 plus shipping from 44134.

Dominic,

If money isn't a problem, I'd suggest going with a multiband mobile
antenna, such as the Outbacker, a Texas Bugcatcher, or something
similar. You'll have to go to the roof to change band taps, but
the performance would be reasonably good, and the antenna would
meet your height restrictions.

Keep in mind also that, no matter what kind of vertical you end
up with, you will need a counterpoise.

Contact Dave Benson, NN1G, and see if he still offers his "Small Wonder Labs" QRP transceivers. They are based on the NE-4040 design. I have built two of them and they work VERY well for the price (both have been about $50). They have a superhet receiver with crystal filtering, full QSK, 1 Watt+ output, etc. They were sold for 80m and 40m, and perhaps 20m. Mine are both on 40m.

I have a large quantity of crystals and receiving tubes that are surplus to my needs.

Crystals:

50 pcs 15.620 MHz
20 35.02 MHz
15 35.52
50 4.4985
20 16.02
25 8.8735
50 5.1735
plus misc others.

Quantities are approximate. Lot price $25 plus shipping. All are unused. Most are for FT101 or 301 radios.

Lots of recieving tubes, some nos and some used/boxed. Maybe 300 or more. All the usual types for communications receivers, etc. Lot price $100 plus shipping.

Check out W1FB's QRP Notebook and also QRP Classics pubbed by the ARRL. Lots of minimalist designs and also some fairly sophisticated circuits too. Your biggest problem is getting toroid cores for inductors. Rat Shack refuses to carry them. Most other parts or close equivelants are gettable there. BUT... they can be expensive. a 20 cent capacitor typically costs 79 cents there.

Pay a visit to http://www.mouser.com and ask for their hardcopy catalog. The online catalog is REALLY slow, as is online ordering, but you can order by email or snailmail. No minimum order either, but I think a two buck minimum shipping charge. They are not the cheapest, but they are a third the cost of RS on small parts and they keep an excellent inventory. Anything you need for QRP construction, they have. They are truly a one stop shop.

PC-VFO is the DDS RF Signal Generator Card for your PC.

This DC-54 MHz DDS Signal Generator operates from an ISA port in virtually any PC. Because of its architecture, it can operate at unprecidented speed compared to serial or parallel port external models or PIC conrolled standalone units. And, because we supply all the source code for the applications supplied with PC-VFO (DOS & Windows) alongh with detailed programmig instructions, you can write your own custom test sequences or operating software.

ByteMark is proud to announce that RT SYSTEMS of Hunsville, Alabama, will be carrying the PC-VFO and will have them available at the hamfests they attend. Go to http://www.rtsars.com and find out when RT-SYSTEMS will be at a hamfest near you. Stop by and see them, and pick up a new PC-VFO!

You can call RT SYSTEMS Toll-Free at 1 800 723-9292 Tell them you got the number from this newsgroup post!

Bob-

Did anyone ever respond?

According to the General Electric "1974 Replacement Semiconductor Guide", the HEP-170 can be replaced with a GE-509. The GE-509 is a "Silicon Rectifier, 1000 PRV, 1 Amp."

In case the original diode stacks didn't include it, I suggest you parallel each diode in a string with a ceramic capacitor, 1 nanofarad, working voltage GREATER than 1000. This causes transient reverse voltages to divide equally along the string. Otherwise, the high frequency component of the transient will divide according to the individual junction capacitances of the diodes.

There is a related rule of thumb, to also use parallel high-value resistors. However at low frequencies and DC, the diode's reverse voltage will only build up to its zener value and stop, until all diodes in the string reach theirs. Therefore, you would be wasting resistors!

Cross-posted to:
alt.radio.scanner,rec.radio.scanner,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I need some help with a tape recorder interface I'm building.
I'm trying to add a small jack to my scanner that'll plug
directly into a tape recorder's "remote" jack via a cable
that'll automatically start the tape recorder when the squelch
is broken and will stop it when the transmission stops.

If I use a RS 42-2152 dubbing cable, this'll condense a whole
night's, or even day's, scanning into just a few minutes. It'll
also have other useful purposes.

I know it has to do with the Scan Control pin, but how do I go
about doing this? I'm looking into it closing a relay when the
pin goes active so that the two devices will remain isolated.

I plan on doing this mod to several scanners, so general
instructions about how to do it with different battery sources,
different pins, etc., would be more than helpful for me and a
couple of friends.

Remove the second, anti-spamming N from the
end of tdragon in my address to respond,

5766. FS: 5KV DPDT Vacuum Relays

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-12 00:00:00 UTC
From: Ed Fallon <efalon@wolfenet.com>
Message-ID: <3581F5E6.4F288736@wolfenet.com>
Source record: 82201

I have about 60 KILOVAC high voltage relays PN H-4/S1 for sale. These are pulls from working medical equipment with low useage and are fully tested. They are small reed type, vacuum, glass encapsulated with the following specs:
Contact Voltage 5KVDC
Continous Carry Current 10 amps DC max
Switching Current 1 amp capacitive load
Contact Resistance 0.2 ohms max
Coil Resistance 100 ohms
Coil Voltage Range 8-15 VDC

These are really neat little relays and I think these would be great for making custom antenna switches or whatever your needs. They have fly leads for the coil and solder tabs for the relay contacts. If you're interested there is jpg photo of these at http://www.wolfenet.com/~efalon/kilovac.jpg or email for a jpg photo.

Price is $10 ea or $8 for quanities of 4 or more. Minimum order is $20. Shipping is $5.
Email to check availability and to order.

Thanks,
Ed Fallon

What about the Petition of Right in 1628 and the Bill of Rights in
1689? After reading these two documents, I am convinced that the
American Revolutionists used their phrasology and influence when
writing our own Constitution and Bill of Rights. These two English
documents make very interesting reading if you like history, as I do.

Oh, yea...how much for the Magna Carta?? :)

5769. RCA DDS 18 inch Dish Antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-13 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <3582ABF3.8DF5B3E7@lafn.org>
Source record: 82063

Hi,

Someone threw away at the curb a Satelite Dish Antenna
marked RCA DDS. Could not resist temptation.
Brought home all I saw which did not
include any convertor box.

Fiberglass Dish is 20 inches high and 18 inches wide.
Feed horn assembly is there with an electronic assembly inside.
Looking at that assembly I see one type F conenctor with
RG-6U coax cable connected. Need tiny Bristle wrench to open assembly.

My activities do not include any Satelite HAMMING and I do not use
Cable TV.

I do work with a Poor Man's Spectrum Analyser made with TV Varactor Tuners.
It would be nice if I could use these electronics to
extend my frequency coverage.

Looking for newsgroups to get DC power needs, input frequency and IF ouput
frequency. Looking for definition of LNA and LNB electronics relating to DSS.

What can I do with this device?
Thanks for any help, suggestions.

73, W6MIK

Hi, tube folks!
I have been working on CD-ROM reproduction of

Sylvania Technical Manual 1943(Red book)
Sylvania Technical Manual 1949(Blue book)
Sylvania Technical Manual 1959(Yellow/black book)

Recently I finished one CD-ROM that contains
the 1943 version and 1949 version of their manuals.
It comes with HTML file that allows you to browse
every page of the manuals.
Before I go for pressing a lot of them, I would like
to know some inputs from you.
If you will give me some feedback I would apreciate.
If you are interestead in, please e-mail me.
You can eather send to this e-mail address or

tamagawa@cig.mot.com

Thanks,
Atsunori

Boat Anchors for Sale

1. Heathkit Stuff $200.00:
SB-301 in good working order.....15.lbs
SB-401 final amps (61146) blown.....25.lbs
D 1410 keyer.....4.lbs
Turner 454C Microphone.....2.lbs
Heathkit Manuals 2.lbs
Packing.....10 lbs
Shipping weight.....57 lbs

2. Gonset Stuff $125.00:
G66a Receiver with Power supply.....16 lbs
G-77 Transmitter with modulator/pwer supply..30 lbs
Gonset Manuals and cables.....1 lbs.
Packing.....10 lbs
Shipping Weight.....57 lbs
Receiver and transmitter works.
No microphone

3. Siltronix 1011D Comanche 150.00.....22 lbs
Manual (from "Manuals Plus").....0 lbs
packing.....7 lbs
Shipping Weight.....29 lbs
Needs mike and re-alignment. Was de-tuned down to
Novice portion of ten meter band

4. National NCX-3 Tranceiver $75.00.....19 lbs
External Power Supply/Speaker.....25 lbs
National Manual.....1 lbs
Packing.....10 lbs
Shipping Weight.....55 lbs
SSB AM CW on 20,40,80. Needs work

5. Heathkit "Seneca" 6 M Transmitter..$75.00.....50 lbs
Heathkit Manual.....1 lbs
Packing.....10 lbs
Shipping weight.....61 lbs.
Loads up into dummy antenna.

I would prefer you pick up. If I ship you must pay postage. These are heavy and will be shipped from zipcode 95822. I've included the weights of the items as well as the weight of packaging materials. All for-sale-items weighed by placing the items on the Pelouze Model Y50 Postage Scale.

If interested contact me by email gwilljo@cwo.com.

I have the following RF Connectors and adapters for sale. I would rather sell them as a complete lot. All are USA made military type (No imported junk)

Pat Bunn, N4LTA

3 Pomona BNC to SMA Gold Plate New in the bag
4 TNC Panel Jack 4 hole mtd Omni Spectra , new in bag
3 Amphenol UHF SO239 panel jack, Extra long , new in bag
2 same as above but standard length, new in bag
7 United Microwave type N panel jack, new in bag
3 Silver Plate UHF connector for RG8, new in bag
1 Pasternak UHF male to N female adapter, new in bag
1 Amphenol Female BNC for RG58, new in bag
1 Amphenol BNC panel Jack 4 bolt, New in bag
1 Kings N female to N Female adapter, New
1 N male to N Male Adapter, Very Good condition
2 N type "T" Like new
1 N female to BNC male adapter Like New
2 Kings N Female to N female, Like New
1 N male to UHF female (Pasternak) like new
1 Amphenol Female "T" with Male branch , like new
2 Above but used, very good condition
1 BNC male to N female, Pasternak , like new
2 BNC Male to UHF female, very good condition
3 BNC Female panel Jack , 4 bolt mtd, like new Amphenol or equal
1 UHF right angle Male to Female, New, teflon
2 As above used
2 BNC male to BNC male , new
2 BNC Female to BNC female , New
3 BNC bulkhead jack, new
3 BNC right angle, male to female, used
1 UFH female to UHF female, used

Pat,

I am interested in your wattmeter, but I am unfamiliar with the specifications of this model. I need to be able to measure from 10 mw to 30 watts in the 2 and 6 meter bands. I have used Bird equipment in the past, but I no longer have access to it. From the description of my needs, does it sound as if your HP430 would fit the bill?

Our radio shop has under gone a few changes and is updateing some of
the shops test equipment. We have the following test equipment for sale.

(1) Tekronics 150 MHz 4 channel scope Model 2445A,
asking price is $1,700 in Canadian funds or $1,100
in US funds.

(2) IFR service monitor model 1000, asking $2,000 in
Canadian funds or $1,250 in US funds.

(3) Marconi automatic distortion analyzer, this is only 2 years old
and I think we paid about $3,000 for this unit. Asking $950.00
in Canadian funds.

All the equipment listed are in very good working order, and clean and
look good, as all this equipment has been cared for and maintained.

Don't forget to use molded RF chokes around the oscillator circuit to
help reduce the noise generated by resistors.

Walter, I would recommend Homer L. Davidson's book: "Radio Receiver Projects You Can Build". Pubbed by Tab/McGraw-Hill, copyright 1993. ISBN 0-8306-4189-0, or ISBN 0-8306-4190-4 in Paperback. There are crystal sets, TRF, Regenerative, Direct Conversion, and Superhet receivers, using discrete transistor, ICs, and vacuum tubes. You should be able to find all the parts called for, and suppliers are named for most parts. It's pretty easy to follow and assumes no prior knowledge of electronics. Basically cookbook method construction, though some theory of operation is covered and you will learn SOMETHING about radio by building any of these projects.

A good receiver can be tricky and complicated. Usually, a ham's first homebrew radio is a simple transmitter. Transmitters are far easier to build and get working than receivers. By the time a ham is ready to tackle a receiver, he usually knows a good bit about basic electronics and radio theory/design/construction. So, most published designs for receivers aimed at hams assume a fair amount of knowledge. Davidson's book does not, and is ideal for an inexperienced builder who would rather tackle a receiver first for whatever reason.

Don't be afraid to mix and match circuits from various designs once you have got a couple of radios to work. For instance, many of the designs in the book call for high impedence headphones, which are now rare and somewhat expensive. If you see a design using an audio transformer to match low impedence (for instance Walkman type) earphones to a receiver, feel free to use the same headphone circuit on another project calling for high impedence phones.

Pay close attention to what the author has to say about antennas and ground connections. Many of the projects will simply not work at all without proper grounding or antenna. Set up these first before building. Your first crystal set will go together in about a half hour. You don't want to wait and wait to listen to your new radio because you don't have a ground yet. Take care of that stuff forst.

More sophisticated receivers can be found in several ARRL publications. The url for the ARRL is http://www.arrl.org.

The electronics module is a LNB, that's a Low Noise Block converter. You power it by feeding 18 VDC (max) up the coax (center positive). The LNB converts the Ku band satellite signals down into the 970-1450 MHz range for use by the satellite receiver. the receiver tunes this range to get the satellite transponders.

You can tweak the local oscillator in the LNB to cover the 10 GHz amateur band (some front end retuning may be required too). This LO isn't the most stable thing in the world since the desired signals are 36 MHz wide and the sat receiver has AFC. For narrowband work, you'd want to arrange some sort of stablization for the LNB's LO. But it could be used as the first conversion of a high sensitivity receiver in conjunction with a WBFM gunnplexer transmitter as is.

It may be possible to modify the IF of the LNB so that you can use a lower frequency receiver with it. That would let you use the PMSA as a tunable IF stage for it. (Or use a standard FM broadcast receiver for WBFM with that gunnplexer transmitter.) Alternately, you can put a 1.2 GHz converter between the LNB and your PMSA or FM receiver.

You can also just pitch the LNB and mount a gunnplexer in its place on the dish. This size dish is very useful for 10 GHz hamming. But it would be a shame to pitch the LNB, it has a very good GASFET preamp in it, and a few other choice microwave parts.

you know, I tried that with tape recorders. they aren't very good at it. even hi quality ones have problems with clipping and whatnot. The *best* solution out there is a program called RecAll. It operates like a VOX recorder with a few improvements: record time is only limited by the size of your hard drive (usually 10+times what you'd get with a measly tape, yech!), and it's start and stop for VOX mode is instantaneous.

In Europe,many Amateur TV enthusiasts have sucessfully modified
satellite LNB's for the 10GHz amateur band.
To do this properly you need to relpace the dielectric resonator or
"puck" that is the frequency determining component for the local

oscillator.A spectrum analyser & scalpel + some copper shim or tape
is needed to properly realign the front end.
Once this is done,a normal analogue satellite receiver can be used
as a pretty sensitive ATV receive setup.
The older manually-tuned receivers are far more convenient than modern
push-button or remote-controlled jobs -& may be found at
hamfests/rallies & possibly from dealers who get them as trade-ins
when a customer upgrades.
A simple gunn-diode based transmitter & video modulator can be built
for a transmit setup;iontercarrier sound can also be added.
The gunn unit is best fitted to a further separate small dish.

Chris Muriel,(G3ZDM) Manchester.

I have a new , never opened, 40 Watt integrated amplifier kit with
matching transformer.
I planed to use it to modulate a pair of 807s with a filament
transformer as modulation transformer. I never got around to building
it. I also have a suitable computer grade electrolytic filter cap and
rectifier diodes. $45 for everything including shipping.

RecAll v2.2 Sagebrush Systems.
Sound-activated recorder for Win-
dows. Includes time-stamping of
WAV file data. Great for recording
ideas, notes, dictation, radio
scanners. Requires sound card with
microphone input (Auto Gain Control
AGC recommended) and Win95/WinNT4

Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

There are some Heathkits that I have been looking for
and I wonder if anyone has ever actually seen, built,
or owns one of these radios? What is the most
amazing to me is the FM car radio. Has anyone even
met anyone who actually claims to have known someone
who once saw a Heathkit FM under-dash car radio???
My hope is to get photos and someday own these
radios. (My hope for the car radio is to someday
meet someone who once saw one.)

Model GR-61 FM portable (transistor)
Model GR-41 FM Auto Radio, (transistor)
Model GR-10 AM table radio (tube)
Model GR-11 FM table radio (tube)
Model GR-121 AM clock radio (tube)
Model GR-131 AM table radio (transistor)

Some of the original Heathkit literature can be
viewed on my web site:
www.somerset.net/arm/fm_only.html

Thanks for any leads!

5807. Help, adapting electret mike to ADI AT-201 HT

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-14 00:00:00 UTC
From: larik@badger.tds.net
Message-ID: <3583ec39.1292706@204.246.1.19>
Source record: 82092

I am trying to adapt a David Clark aircraft headset to a ADI AT- 201
HT. The mike plug dos'nt seem to disconnect the speaker mike.
I,m also not sure how to get power to drive the mike.
I'm somewhat electronically challenged (dumb).
Unit works great, 100+ mile range on 5w at 5000ft,
except for terrific engine and wind noise on xmit.
Thanks for any help.

Subject: ** FLEA at MIT ** Sunday June 21st Cambridge MA
Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming Sunday...

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 21st 1998
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

Sellers Season Passes are again available until
April 19th for only $50 per space for all 7 meets !!

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

5811. Schematics for 2m amp with 4CX250.

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-14 00:00:00 UTC
From: srwhite@ibm.net
Message-ID: <35842d23.0@news2.ibm.net>
Source record: 82096

I am looking for a source for schematics and other info on building a 2 meter repeater power amp using 4CX250's (to which I have access to literally a dozen). I have been told that tube amps are the way to go for repeater PAs over 50w.

I think the ARRL publishes a book that I can use, but I don't know the title off hand... And are they available from the bigger bookstores?? (ie Bordersm Barnes&Noble)...

Thanks!

Just me again... :-) This time I'm going nuts over mikes. I've got an old unmarked Drake mike, labeled as a 500 ohm dynamic, 4 pin connector, measures 490-500 ohms between pins 1 and 3. Then there is the Drake 1525EM(the one with the DTMF encoder... anyone have a PDF datasheet for the MC14410?), I guess similair to the other one but I get the 490-500 ohm reading between pins 1 and 4. None of the readings seem to change when I hold down the PTT button(which I already knew, they aren't working all that well. Needs a good cleaning, I guess). What's going on there? OK, on to the third. It's from a Pearce-Simpson Tiger 23(no longer functional... The radio, not the mike) with a 3-pin connector. When I push the PTT button, I get around 130 ohms between both pins 1 and 3 and between 1 and 2. What I want to know is what kind of mike is the Pearce-Simpson, how do I hook it up with a 4-pin like the Drake mikes, and what's the deal with the difference between the two Drakes? And should I even try this conversion, or should I use a different mike for my various projects(to keep things simplle in the future as I get more of both commercial and homebuilt radios)? Are the old Drake type mikes pretty common for older equipment(ther 1525EM came with an old xtal 440MHz FDK rig, and the unmarked brown mike came with a xtal 2m Kenwood)?

BTW, besides guns the other thing they don't allow in school is the
posting of a little rule that goes: "Thou shall not kill".
That, and the other "fanatical religious right-wing" teachings that
goes along with it, are what could have created a more caring
student in general. The lone nut may or may be been helped, but people
would have been less tolerant to not criticizing his anti-social
behavior. Nobody wants to be "too judgemental" about anyone else no
matter how much of a vicious crackpot they may be. Congratulations:
that is our society thanks to the godless, virtueless, liberal
hatchery known as our public school system. That entire system must be
knocked down with a wrecking ball today. So what if they have to be
home-schooled or not schooled at all for a year or two! Being away
from those liberal mamby-pamby teachers and their social promotion
mill would be the best education possible.
The viciousness has spilled over even to young adults whose families
have big bucks. (The two darlings who knifed and gutted a middle-aged
man in central park so the evidence would sink. paraphrase - "He is a
fatty you have to gut him because he'll float." - nice girl.)
They didn't have a gun. I wish the man did, even if it were illeagal.
Do you hear me Mr Schumer (D)?

Thanks for the suggestion, but I allready thought of that. The
problem with that is that I plan on doing this on the go from my car, and
sometimes even hotel rooms uning handheld scanners. I'd have to either
lug around a full desktop computer system, or dish out $1k for a nice
laptop with a built in soundcard. Either of which for what I want is
pretty impractical.
I've tried a VOX tape recorder, but don't like the performance. I
want to give this kind of interface a try, but don't know much about
designing circuits. I'm hoping someone out there knows something about
this and can help me.

(Repost. Crossposted to fewer groups, multiple times.)

LAST CALL FOR VOTES (of 2)

Votes must be received by 23:59:59 UTC, 22 Jun 1998.

This vote is being conducted by a neutral third party. Questions
about the straw poll should be directed to the rec.radio.amateur.*
Working Group at <rra-wg@theporch.com>

Votetaker: Jeremy Billones <billones@primenet.com>

STRAW POLL Q & A

Q: Who is doing this?
Q: How may I join the rra-wg?
Q: Why are we doing this?
Q: What are we doing?
Q: More to the point, why are we "kicking over this hornet's nest?"
Q: Why do you want to change the newsgroups again?
Q: Who are you to tell us what to do with "our" newsgroup?
Q: How long ago were each of the rec.radio.amateur.* newsgroups created?
Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?
Q: Where can I obtain a copy of the original newsgroup charters?
Q: Where can I find out more information about the Usenet RFD/CFV
process?
Q: I don't want any of the newsgroups to change. What should I do?
Q: I want to go back to one single newsgroup for amateur radio on
Usenet, like we had back in the 1980's. What should I do?
Q: I support some of the newsgroups for amateur radio, but not others.
What should I do?
Q: I support the existence of a newsgroup, but disagree with its
charter. How should I vote?
Q: I would like new newsgroups to be created, what should I do?
Q: I have no opinion, what should I do?

Q: Who is doing this?

The rec.radio.amateur.* Working Group (rra-wg@theporch.com, which
initiated the last major reorganization in 1993) is the point-of-contact
for questions about this opinion poll. Principal members are Paul
W. Schleck, K3FU, and Jeffrey Herman, KH2PZ. Though not an rra-wg
member, Gary Coffman, KE4ZV, also endorses this opinion poll. this
opinion poll will be conducted by an unbiased third party from the
Usenet Volunteer Votetakers (UVV), Jeremy Billones

(billones@primenet.com).

Q: How may I join the rra-wg?

Anyone who volunteers may join the rra-wg. The rra-wg has always solicited volunteers from when it was created in 1993 (originally named rra-reorg) to draft an RFD to reorganize the rec.radio.amateur.* newsgroups (and continues to serve as an advisory group for FAQ maintainers and new newsgroup proponents). You may join the rra-wg by subscribing to its mailing list.

The automated list manager address is

listproc@theporch.com

Use this for subscribing, unsubscribing, getting archived info, getting the FAQ message, changing your address, etc.

To subscribe, send a message to this address with "subscribe rra-wg <your name>" Similarly, to unsubscribe, replace "subscribe" with "unsubscribe"

The list owner address is

listown@jackatak.theporch.com

Use this address only when there is a problem which really truly can't be resolved otherwise.

Q: Why are we doing this?

Discussion on the rec.radio.amateur.* newsgroups shows that there is a difference of opinion about the current newsgroups and their charters. Assertions on one side of the argument that the charters were voted upon by the readers have been countered with assertions on the other side that the votes took place years ago, by a very small minority of the current readership. There is also the strongly-held opinion among some that we have "too many newsgroups." The following is a sample posting from the discussion thread on rec.radio.amateur.misc that led to this opinion poll (the entire thread may be viewed at DejaNews, http://www.dejanews.com/):

Q: What are we doing?

As a preliminary (and perhaps even diverting) step to an RFD (which would be very laborious and time-consuming, and perhaps unnecessary), we will conduct a Straw Poll, or "Vote of Confidence" (similar to the vote of confidence for a Prime Minister made by British Parliament, or a non-binding resolution of the U.S. Congress). We do it Usenet-vote style (utilizing a neutral vote-taker from the UVV). During the poll, a vote is taken where a "Vote of Confidence" yeah or nay for each newsgroup, as currently constituted and chartered, is given by each voter (YES/NO/CANCEL/ABSTAIN votes are valid).

What votes mean:

YES: I support the existence of this newsgroup and its charter

NO: I disagree with this newsgroup's charter or I believe that this newsgroup's existence should be reconsidered in a future RFD/CFV

CANCEL: Delete any previous votes I made concerning this newsgroup

ABSTAIN: I have no opinion concerning this newsgroup

Each newsgroup that does not pass a vote of confidence by Usenet voting standards (2/3 and 100 vote majority of YES versus NO votes) may be referred to the Usenet newsgroup creation process where their deletion or modification (based on a rough consensus of the preceding 30 days of discussion and how much they lost in the vote of confidence) is proposed. Each newsgroup that does pass a vote of confidence will have its charter, and justification for existence, reinforced to the

readership (as the current readership voted on it).

Q: More to the point, why are we "kicking over this hornet's nest?"

Sometimes hornet's nests can get big enough that they wind up falling down anyway. As shown in the thread above, there are significant undercurrents of disagreement over the current newsgroups, their charters, and even the suggested guidelines and rules of net-etiquette that many on the newsgroups advocate. If this opinion poll shows strong agreement with current practices, then that would help reduce (though not eliminate) newsgroup arguments on the subject. If, however, this opinion poll shows strong disagreement, then it's probably better that we know that right away, and take steps to fix the current situation before it degrades any further.

Q: Why do you want to change the newsgroups again?

Only some of the proponents of this opinion poll wish to change the newsgroups. Some wish to simply have the current newsgroups and their charters reinforced. All of the proponents agree that an up-to-date opinion poll of the readership is desirable at this time. Whatever future actions will be taken will be determined by the results of this opinion poll.

Q: Who are you to tell us what to do with "our" newsgroup?

One answer is that on Usenet, no one "owns" an unmoderated newsgroup. Newsgroups are voted into existence by a democratic process to determine consensus (and lack of significant objection) for using shared network resources to support them. All of the existing rec.radio.amateur.* newsgroups passed such a vote at some time in the past, and should pass such a vote again if there is strong support for their continued existence.

Another answer is that this is just a non-binding opinion poll of the readership to determine a consensus, if any, for making changes. It would still be necessary to undertake a formal RFD/CFV process to change any Usenet newsgroup (and that was always possible, anyway).

It should also be emphasized here that no individual rec.radio.amateur.* newsgroup is being singled out. Rather, a consensus of the readership concerning ALL rec.radio.amateur.* newsgroups is being sought.

Q: How long ago were each of the rec.radio.amateur.* newsgroups created?

1972 (or possibly earlier, this date is when UCSD joined the ARPANet):

Info-Hams (original ARPANet mailing list at Simtel-20, continues today at UCSD as a gateway of rec.radio.amateur.misc)

1979:

Creation of Usenet News at Duke and UNC

early 1980's:

fa.info-hams (fa = "From ARPANet") *
net.ham-radio (pre-Kent Paul Dolan "Great Renaming") *

mid 1980's-1991:

rec.ham-radio *
rec.ham-radio.packet *
rec.ham-radio.swap *

1991 Reorganization:

rec.radio.amateur.misc
rec.radio.amateur.packet *
rec.radio.amateur.policy
rec.radio.cb
rec.radio.swap

1992/3 Addition:

rec.radio.info

1993 Reorganization:

rec.radio.amateur.antenna
rec.radio.amateur.digital.misc
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
rec.radio.amateur.misc
rec.radio.amateur.policy
rec.radio.amateur.space

1996 Additions:

rec.radio.amateur.dx
rec.radio.amateur.boatanchors

* = obsolete

Current newsgroups covered by this opinion poll, and the years
in which they were created:

rec.radio.amateur.antenna (1993)
rec.radio.amateur.boatanchors (1996)
rec.radio.amateur.digital.misc (1993)
rec.radio.amateur.dx (1996)
rec.radio.amateur.equipment (1993)
rec.radio.amateur.homebrew (1993)
rec.radio.amateur.misc (1991)
rec.radio.amateur.policy (1991)
rec.radio.amateur.space (1993)
rec.radio.info (1992/3)
rec.radio.swap (1991)

Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?

Though one level up in the rec.* hierarchy, these newsgroups are
principally used by readers of rec.radio.amateur.*, and their fates
would substantially be decided by any significant reorganization of the
rec.radio.amateur.* newsgroups. Though created by a rec.radio.amateur.*
reorganization, rec.radio.cb is not included in this opinion poll.

This announcement has been cross-posted to all rec.radio.* newsgroups
(except for rec.radio.broadcasting and rec.radio.info, which are
moderated). In addition, the following individuals were consulted prior
to this announcement (note that consultation does not necessarily
imply endorsement):

Richard Eckman, KO4MR, Proponent of rec.radio.amateur.dx
Brian Kantor, WB6CYT, Administrator of Info-Hams/Ham-* mailing list
gateways of rec.radio.amateur.* newsgroups at UCSD
Ian Kluft, KO6YQ, Proponent of 1993 rec.radio.amateur.* reorganization,
former rec.radio.amateur.* FAQ Maintainer
Jay Maynard, K5ZC, Proponent of 1991 rec.radio.amateur.* reorganization
Brian Short, K7ON, Moderator of rec.radio.info
Rick Stealey, K2XT, Proponent of rec.radio.amateur.boatanchors

Q: Where can I obtain a copy of the original newsgroup charters?

ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.info
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur-reorg
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.dx
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.boatanchors

Q: Where can I find out more information about the Usenet RFD/CFV
process?

ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Create_a_New_Usenet_Newsgroup
ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Format_and_Submit_a_New_Group
_Proposal
ftp://rtfm.mit.edu/pub/usenet/news.groups/Guidelines_on_Usenet_Newsgroup_Names

Q: I don't want any of the newsgroups to change. What should I do?

Vote "YES" for all of the existing rec.radio.amateur.* newsgroups.

Q: I want to go back to one single newsgroup for amateur radio on
Usenet, like we had back in the 1980's. What should I do?

Vote "NO" for all (or all but one) of the newsgroups.

Q: I support some of the newsgroups for amateur radio, but not others.
What should I do?

Vote "YES" for any newsgroups that you wish to remain unchanged, and
vote "NO" for any newsgroup you wish to have reconsidered in a future
RFD/CFV.

Q: I support the existence of a newsgroup, but disagree with its
charter. How should I vote?

Since this opinion poll is for both the existence of given newsgroups
AND their current charters, you should vote "NO" for that newsgroup.
Again, this is a non-binding opinion poll simply to determine if current
newsgroups should be considered for modification or deletion, not a vote
to actually modify or delete these newsgroups.

Q: I would like new newsgroups to be created, what should I do?

Creation of new newsgroups is not being considered by opinion poll. A
future RFD/CFV would have to be initiated to do this. You are, of
course, welcome to express your opinions concerning new newsgroups by
posting them to rec.radio.amateur.misc (*NOT* by E-mail to the
vote-taker).

Q: I have no opinion, what should I do?

You may wish to read the preceding 30 days of public discussion on
rec.radio.amateur.misc about this opinion poll to develop your own
opinions (go to http://www.dejanews.com/ and search for "STRAW POLL").
If, after reading the public discussion, you still remain undecided, you
may abstain from this opinion poll. You may do so informally by not
participating in it at all, or formally by explicitly voting "ABSTAIN"
for all of the newsgroups.

IMPORTANT VOTING PROCEDURE NOTES:

Standard Guidelines for voting apply. One vote per person, one account
per voter. Votes must be mailed directly from the voter to the votetaker.
Anonymous, forwarded or proxy votes are not valid. Votes mailed by
WWW/HTML/CGI forms are considered to be anonymous votes.

Vote counting is automated. Failure to follow these directions may
mean that your vote does not get counted. If you do not receive an
acknowledgment of your vote within three days contact the votetaker
about the problem. It's your responsibility to make sure your vote
is registered correctly. Duplicate votes are resolved in favor of
the most recent valid vote. Addresses and votes of all voters will
be published in the final voting results post.

HOW TO VOTE:

Extract the ballot from the CFV by deleting everything before and after
the "BEGINNING OF BALLOT" and "END OF BALLOT" lines. Don't worry about
the spacing of the columns or any quote characters (">") that your
reply inserts. Please, DO NOT send the entire CFV back to me!

Fill in the ballot as shown below. Please provide your REAL NAME and
indicate your desired vote in the appropriate locations inside the ballot.

When finished, MAIL the ballot to: < voting@clark.net >
Just "replying" to this message should work, but check the "To:" line.

Examples of how to properly indicate your vote:

```
[ YES ] example.yes.vote
[ NO ] example.no.vote
[ ABSTAIN ] example.abstention
[ CANCEL ] example.cancellation

DO NOT modify, alter or delete any information in this ballot!
If you do, the voting software will probably reject your ballot.

If these instructions are unclear, please consult the Introduction to
Usenet Voting or the Usenet Voting FAQ at http://www.iki.fi/~jpatokal/uvv.

======== BEGINNING OF BALLOT: Delete everything before this line =======
.-------------------------------------------------------------------
| 1ST STRAW POLL: rec.radio.amateur.* reorg
| Official Usenet Voting Ballot <RRSP-0002> (Do not remove this line!)
|-------------------------------------------------------------------
| Please provide your real name, or your vote may be rejected. Place
| ONLY your name (ie. do NOT include your e-mail address or any other
| information; ONLY your name) after the colon on the following line:

Voter name:

| Insert YES, NO, ABSTAIN, or CANCEL inside the brackets for each
| newsgroup listed below (do not delete the newsgroup name):

I don't know about the ADI. Here's what I did with a Kenwood and
an electret headset mike.

The Kenwood mike connector provides 8 VDC. I fed that to the mike
through a 47 kOhm resistor (8VDC -> 47K -> mike -> GND). I take
the audio from the top of the mike (47K <-> mike connection point)
through a 0.022 uF polyester cap to the mike connector.

A disc ceramic cap of about 0.01 to 0.1 should do fine. I just like
polyesters because they provide better audio quality.

The published circuits I've seen show 10K resistors with a 12 VDC
supply. I found by experiment (with several helpful critical Hams
and a deviation meter) that this provided much too much drive. So
you may also need to experiment with the resistance if you want
good audio (doesn't everyone???).

5820. re: Using RCA DSS Dish and LNB

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-15 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <358532B5.901A7A98@lafn.org>
Source record: 82015

Hello to group and Gary Coffman and Chris Muriel for the
info about uses for my RCA DSS curb discarded dish.

Very pleased with the potential uses for this dish.

Your recommendations created a few more questions.

1. Is the LNB tunable to different satelite sigs in KU band
by varying the 18 volt DC power to the LNB?
Sounds like Satelite signals,
from LNB IF signal output signal are each 36 mhz BW.
Must be many Satelite signals, after down-converting,
in the band from 970 -1450 mhz? What are the KU band
frequency limits?

2. What is the "PMSA"
"........That would let you use the PMSA as a tunable
IF stage for it............."

3. Coating on the fiberglass dish is chipped in a few places
around edges. Is this a problem?

4. White paint has beeen splashed on front surface of
dish. Is this a problem.

My present anticipated use for the dish system will be in the
Receive Only mode, not to transmit.
Maybe transmitting will become a need, but would be far in future.
This might influence your replies to me.

Thanks again for VERY USEFUL HELPFUL info both in USA and Europe.

That isn't accurate reporting. A pair of UHF's and a double-female
connector just happen to be series-resonant at 2GHz. They were worse
than the Ns both above AND BELOW this frequency.

>And, the UHF guys held their own through out the test range.

That judgement depends on your engineering standards.

Good-quality UHF connectors cause a small reactive impedance bump which
involves no resistive loss, just a small change in VSWR. However, if you
have several in-line UHF connectors the small impedance bumps can
combine in unexpected ways, according to the electrical lengths of cable
between them. This can become significant on 144MHz and above.

Also, UHF connectors have notoriously poor quality control unless you
buy MIL-quality parts. Some UHF connectors will melt at US legal power,
especially on 144 and above. Some have out-of-tolerance threads that may
or may not mate. Some UHF elbows use a steel spring inside!

>So, maybe they
>ain't so bad after all. They are kinda universal and reasonably cost effective.
>I know N connectors are supposedly "waterproof" (although, I have found water
>in them!) and that UHF connectors are not. And that N connectors are supposedly
>better impedance-wise. But, when you look at those test results, you have to
>question the bad rap that UHF connectors have been given.

It's not that they don't work, but...

No, the voltage is regulated inside the LNB. This is a block converter,
it downconverts the entire band at once.

> Sounds like Satelite signals,
> from LNB IF signal output signal are each 36 mhz BW.
> Must be many Satelite signals, after down-converting,
> in the band from 970 -1450 mhz? What are the KU band
> frequency limits?

I made an error in the original post. C band signals are 36 MHz wide.
Ku band signals are 54 MHz wide. This is for "full transponder" signals,
half transponder operation is often done, so the signals would be half
this width. And there are many narrower band signals also relayed
by satellite, IE SCPC data and audio services, these are typically
about 150 kHz wide. The Ku downlink band is from 11.2 GHz to
12.2 GHz. A typical satellite uses 24 transponders, each capable
of relaying one full width signal or several narrower signals.

Note you can use a scanner covering the IF range of the LNB to
listen to some of these narrower signals. You may need to open
up the IF filter of the scanner a bit if it doesn't have provision to
receive medium deviation signals.

> 2. What is the "PMSA"
> "........That would let you use the PMSA as a tunable
> IF stage for it............."

Poor Man's Spectrum Analyzer.

> 3. Coating on the fiberglass dish is chipped in a few places
> around edges. Is this a problem?

No. You can patch it with fiberglass repair gel (available at automotive
supply stores) if you like, but it won't affect the electrical performance
of the antenna.

> 4. White paint has beeen splashed on front surface of
> dish. Is this a problem.

No. Latex house paint is essentially transparent to RF.

Source record: 82020

I have seen good quality PL259 connectors - silver-plated,
even - but if you're spending that much for a connector,
it's no longer all that cost-effective.

If I'm building it myself, I favour N connectors for things
that transmit, and TNC for things that don't. While supporting
two connector standards has some overhead, I'll never blow up
a preamp by transmitting into it...

What sums it up for me is the definition of UHF at the time
PL259 "UHF" connectors were designed.

Hi Walter OM,

When you say "radio", do you mean a radio receiver, or a transmitter?
Historically, we hams have used the term "rig" to indicate a transmitter
or a receiver or transceiver "Radio" or "set" is the historical term
for broadcast radio receivers, although I notice many newer hams,
particularly VHF/UHF operators, seem to use the "radio" term. It is
interesting to me that modern radio-linked equipment is referred to by
the archaic term "wireless". No doubt a Marketing decision; go figure.

That out of the way, I would suggest starting with a simple
transmitter. There are many kits available as well as articles on
projects. The NORCAL QRP CLUB in California has a web page (do a search
on NORCAL) with info on QRP kits that are easy to build and well
designed. The ARRL books like W1FB's QRP NOTEBOOK, and others, have
many proven simple circuits for rigs.
I run a homebrew 40W XMTR myself on CW and FSK, using a
direct-conversion phasing type receiver patterned after the one by Rick
Campbell in January 1993 QST. PC boards are available for this
receiver from KANGA U.S. The performance of this receiver is
excellent. This is probably not a good first-time project, although if
you already have electronics training as you indicated, the circuits
will be easy to understand and troubleshoot, since the receiver is
(almost) all audio circuitry. Get ahold of the article and see for
yourself.

> connector just happen to be series-resonant at 2GHz. They > were worse
> than the Ns both above AND BELOW this frequency.

Oh come on Ian, the differences were pretty small!! Especially when you consider the accepted "reputation" of each series of connectors!! Why, based on the opinion of many, one might expect the RCA phono connector to out perform the UHF series!!

Here is an "accurate" report quoted from January, 1998 "QST", page 59:

Alan Bloom, N1AL, used an HP8753 RF network analyzer and a test setup to contrast the losses of the lowly UHF connector to the highly respected N connector. The results are shown below:

Freq (mHz) N (loss dB) UHF (loss dB)

1.8 0 0
30 0 0
100 0 0
150 0 0.01
200 0 0.015
450 0 0.09
600 0 0.13
900 0 0.33
1000 0.025 0.4
1300 0.05 0.43
1600 0.025 0.25
2000 0.025 0.01

End quote.

Now, what was inaccurate about my original post?

And, I didn't say anything about these connectors above 2 Ghz!!

I never said the UHF connectors were better or even as good as N connectors. BUT, they certainly are not as bad as some people make them out to be . . .

And, I'll bet BOTH series benefit from the series resonance you mentioned. How else to explain no loss increase from 1600 to 2000 Mhz for the N series??

Lower losses to you,

Bill

either may work, but I would choose a valve with small capacitances and
low heater current for oscillator. 6DA6 is a recommended oscillator
valve, is it for AGC, but does work fb. I have also good experience in
using 6BL8/6U8 with the triode as oscillator and pentode as buffer with
5.5MHz lowpassfilter in Yaesu FL-dx-500. Another suggestion is to use a
semiconductor circuit oscillator fed from raised cathode voltage of the
buffer pentode.

without the set/reset functions it may be easy to use another regulator
like uA723 with some smaller modifications.
I have designed regulators using MC1469G and MC1469R, I built a smaller
psu using MC1469G, but unfortunately it lasted only 25 years, so I had
to reconstruct it using MC1723CP

5840. IC-751A and Willco NoFail Memory Mod

Newsgroup: rec.radio.amateur.homebrew

I bought a Willco Electronics memory replacement module a year ago, but just got around to installing it. The thing makes the radio run OK, but I'm not sure that the 32 memory spots are working correctly. I haven't installed it for 1024 memories yet.
Willco ELectronics had an email address, but I can't find it. Called but they haven't returned call yet. ANybody got some experience with this thing in an IC 751A? Need to discuss a few things.

5841. UHF connector ratings?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-15 00:00:00 UTC
From: raylarue@gte.NET
Message-ID: <358499DC.4D5CA83@gte.net>
Source record: 82102

A friend of mine asked the following question. Anyone offer any references on the subject?

"Does anyone have any definitive data which plots PL-259/SO-239 "UHF"
coax connector losses against frequency? Most ARRL texts say this type
of connector should not be used above about 220 MHz because it does not
exhibit a constant 52 Ohm impedance. However, I can find nothing in my
library stating how much loss might be expected if they are used anyway. Any ideas?"

Your attention is appreciated.

the car radio worked very well in my 70" 340 duster.I bought the kit along with the matching amp which mounted on the back of the radio about the time they were discontinued. the price was 39.50 I think.the only problem was that it would de-tune because of the bumps sometimes.

Message-ID: <6m2b2a$dag@sjx-ixn3.ix.netcom.com>
Source record: 82104
Cross-posted to: rec.radio.swap,rec.radio.amateur.homebrew,rec.radio.amateur.equip

I am working on a project requires a few AM loopstick antenna's. The only reliable source that I have found is the crystal radio kit that is sold by Radio Shack. But the local warehouse is completely out of them presently. So hopefully somebody might know of a source of them. I have searched through the Mouser and Jameco catalogs and only found the matching 365pf capacitor.

5844. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-15 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6m26ht$p88@news.Hawaii.Edu>
Source record: 82105
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

a few years ago a thread on this appeared. Someone did an analysis of
the PL259 UHF connector and found that "it ain't that bad". Though not
as good as N or BNC connectors, if UHFs are used in moderation (ie, one
at rig, one at antenna), and low loss coax used, they don't start to
suck until around 440MHz. With low loss coax, any reflections from
the impedance bump of the connector eventually finds its way to the
antenna and air. And the PL259 at the rig is part of the output stage
tuning (the impedance bump is nulled out, in other words). So, it's
not advisable to replace that connector.

After you buy a good book or if you already have enough knowledge you may not need to. A good place to begin is at your local hamfests to pick up all the components to make a radio then find out how to place everything so you don't blow yourself up and finally you will have your own radio that you can say you made. GOOD LUCK Hope you get yourself a radio. 73's KC�CYN

A little blurb appeared not too long ago in QST comparing UHF and N connectors on return loss.

Would you believe at 2 GHz the UHF connectors exhibited lower return loss than the N connectors?

And, the UHF guys held their own through out the test range. So, maybe they ain't so bad after all. They are kinda universal and reasonably cost effective. I know N connectors are supposedly "waterproof" (although, I have found water in them!) and that UHF connectors are not. And that N connectors are supposedly better impedance-wise. But, when you look at those test results, you have to question the bad rap that UHF connectors have been given.

Hello Bill,

Well, what you said was: "Here is an "accurate" report quoted from
January, 1998 "QST", page 59:"

Now, I'm no English major, but it appears to me that you are ascribing
accuracy to the report, not making an accurate quote of what was said
in the report. So, in that regard, I still take issue with the term
accurate:-)
>
>Correct on the "return" loss, my mistake - I should have said "insertion"
>loss!!

An easy enough mistake.
>
>But, the "test" results speak for themselves. Whether or not the "test" was
>valid is not for you or I to say given the information presented in "QST".

Point well taken. Nothing about the measurement technique was defined
other than that an HP8753 was used. The calibration could have been
as simple as a thru normalization or a full 12 term error correction.
I honestly don't know. But, I do *know* that there are *no* precision
(NIST traceable) UHF standards. Therefore, for ARRL to quote three
decimal place accuracy is just fantasy. But they often do this,
witness noise figure measurements quoted to two decimal places without
one mention of any uncertainty.
>
>Since you are so knowledgeable in this area and appear to have doubts as to the
>validity of the data, why not repeat the test yourself using whatever standards
>and normalizations you deem necessary and report the results?

I must restate my point; there are *no* acceptable standards with
which to calibrate the instrumentation. I could repeat ARRL's
measurements if I knew what it was they were measuring or I could
devise a similar test and post equally misleading results.

I don't fault the attempt to settle the issue of the "goodness" of UHF
connectors; what I take issue with is the precision with which the
data are presented. If terms such as "no observable difference" or
"for all practical purposes" or some such weasel words had been used,

I wouldn't raise the issue.

Respectfully,

N7WS

Have an Astron RS-20A power supply that is surplus to me. Would like
to trade it straight up for something I could use such as:

Memory Keyer
HF Transmatch
Drake W4 wattmeter
25W synthesized 2m rig (older models that will tune current splits)
Video Capture card for my PC that I can plug a cam corder into
Stack of blank CD-R's
10" Table Saw

or let me know what you have. I am NOT interested in any converted
commercial uhf/vhf FM stuff, have no use for it.

Hello Wes,

Well, to beat a dead horse . . . The "accuracy" to which I was responding was the post in which Ian had said that my initial post was "not accurate reporting."

Sooooo, I made a verbatim report!! And, it has a high degree of accuracy!! And, thus, it was an accurate report of what was published in "QST". And, thus, my report was accurate. I have no idea as to the accuracy of what appeared in "QST" but, I also have no reason to think there was any bias involved in the "QST" report. It is the only such data that I remember seeing.

What struck me about it was the small differences between the two series thru 600 Mhz and the way the UHF series "improved" at 2 Ghz. I wish there was a "beyond a shadow of a doubt" method to compare these and other connectors. It would be nice to have a such data. There must be a way to do it that would provide such information. What if the test involved several UHF or N junctions in which the total loss was measured and then the "junction" loss was derived by dividing the total losss by the number of junctions? One would think that this method could provide good accuracy if the total loss could be measured accurately. And, it might be considerably easier to measure a 2 dB loss as compared to a 0.2 dB loss!! Heck, I think I could do that with a couple of Bird 43s!! Of course, to satisfy you "accuracy" types, I would have to have the Birds calibrated, etc before and after the test . . . : -)

In any case, I am out of ammo and ideas. I think I'll take some time off from the connector "wars"!! Hold the fort while I am gone, will ya?

Regards,

Bill

The gel-cell will be rated for the number of ampere-hours of charge it can produce. This should be printed on the battery. (If not, compare it to other gel-cells. It'll have about the same rating as another one of the same voltage and physical size.) Divide your power requirement by the battery voltage to determine the current you need. Divide this number into the ampere-hour rating of the battery to find the number of hours it will last. For example, if your power requirement is 12 watts and you're using a 12 volt battery, the current is one ampere. A five ampere-hour battery would last about 5 hours, a 10 ampere-hour battery ten hours, etc.

Three cautions: First, the ampere-hour rating is only valid at a relatively low current -- one that takes about 10-20 hours to discharge the battery. For the example above, a 5 ampere-hour battery has 5 ampere-hours of capacity only if discharged at a rate of 250-500 mA. At higher currents, the capacity is less. You'll need to consult the manufacturer's data to determine how much less. (In the example above, the 10 ampere-hour battery would probably last close to 10 hours at a one ampere discharge rate. The 5 ampere-hour battery would actually last somewhat less than 5 hours.) The second caution is that the rating assumes that the battery will be discharged to some specific voltage, typically around 10.5 volts for a 12 volt cell. If your equipment quits working at, say, 11.5 volts, you won't get all the capacity out of the battery. Third, these batteries tend to deteriorate with time, so if it's been around for a while, it may not be able to deliver its full rated capacity.

I think a circuit diagram or project details were what was wanted here. The theory is OK but the practice is that most inverters around don't provide this sort of power output.

Do you have a diagram ?

Dominic

You can get them straight from Amidon
or Dan's small parts.
Look 'em up on the Web.

I would add another caution. I have been testing two different
manufactures gel cel batteries to verify the capacity rating. These
are batteries in the 85 to 95 amp-hr range. Neither were meeting the
rated capacity using the manufactures specified charging profile.
After many phone conversations and faced with quantified data on the
charging and measured capacity, they admitted that the recommended charging
profile is a compromise between capacity and battery life. Another words,
if you use the charging profile they used to measure the specified
capacity, the battery life is shortened. If you use the profile they
recommend in the data sheet, you will not get the rated capacity.
One manufacture said to expect only 90% of the rated capacity
with the recommended charging profile. I was getting closer to 85%. I did
come up with a modification to the recommended charging profile that I
think will not shorten the life too much and it does produce 90% of the
rated capacity.
So I would suggest getting a battery that is 15% to 20% larger
than your calculation would indicate.

I assembled and used to have one of the FM Stereo under dash units (early '70s vintage) in my '67 GTO. Don't remember the model number. The radio was modular - had an add on power amp, and also a strap on cassette deck. I didn't have the tape deck. The radio was just ok. Well, good for it's time I 'spose. It was better than the factory FM.

Both radio and car ended up rotting in my ex wifes garage unfortunatlty.

Brad: Palomar Engineers of Escondido California will sell you some really useful "Experimenters Kits" containing many well labled toroid cores along with some neat nomographs showing number of turns and resulting inductance. These kits have gotten me through numerous HB projects. I don't have the address, but they must have a Web site (do a search) or check out their ads in QST.

Good luck. Winding toroids is very theraputic!

How can I shape a ten foot length of 1" copper plumbing pipe into an almost perfect circle? I am making a small magnetic loop antenna, and want to go this route rather than either segmented polygonal pipe construction or construction using coax. I have already tried bending 1/2" pipe, using a torch, and a garbage can as a former, and the results

were OK, but far from ideal, and I doubt I can use this approach successfully with the 1" pipe. How much easier is aluminum tubing to bend without kinking?

Have you considered using 7/8in or 1-1/8in copper Heliax or Cellflex
coax? You should be able to get a 10ft off-cut for the scrap copper
price, or less.

The corrugations may reduce the unloaded Q a little, but for ease of
bending it's hard to beat.

My Dad told me years ago when putting in plumbing that to stop kinking use either a spring former inside the pipe (most hardware shops should do one) or fill it with sand or similar first. oddly enough it seems to work.Dominic Baines

i use 3/8" ID and 1/2" ID soft copper tubing. the regular plumbing pipe is far too difficult t bend without kinking and breaking. FIlling the soft copper pipe with fine sand is an excellent suggestion. Keep in mind that loops need not be perfect circles. squares and triangles work just as well (for amateur purposes) as a circle. the biggest hurdle is supporting the airgap at the top of the loop, and the bottom of the loop, where, i presume, you will place your preamp.

i've built a 9' diameter loop this way, and supported it with 2x2 lumber, planted in a large pot of pea gravel. this supported the loop whenever i tilted it sideways to eliminate noise. yes, you can take advantage of loop tilt (to about 30 degrees), along with the bi-directional characteristics of loops to null noise.

Hi Alan -

"A DoppleScAnt" was published by QST in May, 1978 (pages 24 - 28) with a corrected schematic available from the ARRL. 73 magazine published "DF Breakthrough!" in June, 1981 (page 32) of a similar system. Either matches your descriptions. The 73 unit used FET switching of the antennas to gradually turn them off and on rather than abruptly to try for a more sinusoidal modulation of the incoming signal, while QST's system used diodes for a simpler design. Nowadays, either could be significantly simplified and improved but they both look like good starts.

Good luck in your DFing activities!

Jim Horn WB9SYN/6

Check out David Tait's PIC Links Page at.
<http://www.man.ac.uk/~mbhstdj/piclinks.html>
This should point you to most useful places.

If you want to use Basic, you could use the BASIC STAMP available in the UK
from Milford Electronics. Otherwise look at a UK electronics magazine such as
'Everyday and Practical Electronics'.

Good Luck

Compilers tend to be pricey, but you can get assemblers for much
less - you can download a basic but serviceable assembler for free
from Microchip (http://www.microchip.com).

Device programmers depend on which model PIC you want to program.
The 16C84 and 16F84 are ridiculously easy, which is why so many
hobbyist projects use them. Microchip distribute an application
note (589) showing just how easy it is. I built my own programmer
from a design derived from this application note (noppp). It works
fine, and has given my doorstop IBM PS/2-25 a new lease on life.

The other PICs take a bit more work, but are not impossible.

5888. Re: Shaping copper pipe into a circle

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-18 00:00:00 UTC
From: tiemann@spot.colorado.edu
Message-ID: <6mbnq7$gjb@peabody.colorado.edu>
Source record: 81978

There are two kinds of copper pipe available here. One comes in straight lengths, usually 10 feet long, and, well, as you have noticed, kink when bent, unless they're filled with sand or something as others have mentioned. But also there are refrigeration tubings that come in a roll, and are about as soft as butter if butter were a metal. I think I have seen it as large as 1" in diameter. It bends beautifully, though coming from a roll, might need to be unbent to get the diameter loop you want.

I'm interested in making up foam inserts for some suitcases
for carrying radio gear around.

I contacted a local box supplier and they can make/sell sheets
of 2" thick foam (about 4 x 6 feet) but they're VERY expensive;
particuarly in small quantities.

I contacted a local furniture upholsterer and they have similar
stuff but it's still awfully expensive.

Expensive seems to mean something like $3-6 per square foot.

Are there any sources of this stuff I'm overlooking?

From: AMDX <AMDX@worldnet.att.net>
Message-ID: <6mc4pt$q6v@bgtnsc03.worldnet.att.net>
Source record: 81984

I need to amplify a 1mv sinewave to a hard clipped 5 volt squarewave.
The purpose is to compare the phase (to another), so the amp needs
to go high right after the crossover. The amp needs to work from 400khz
to 30 Mhz. I seem to be having a problem with GBW.
Can anyone suggest a transistor or FET array or a dual op amp for this
operation.
Any feedback would be appreciated.

Thanks
Mike

>Where can I get these Amidon cores he is talking about?
>Thanks for the help in advance. . Brad
>W5BK
>bhyde@vvm.com

The last time I ordered from Amidon, they sent me a little data sheet detailing a lot of the cores they sell. t50-2 means "a core made of number 2 powdered iron a half inch in outside diameter". There are places to get cores which may be less expensive than Amidon, such as Dan's small parts, they have a web page at WWW.FIX.NET/dans.html. Both times I ordered from Dan's, the service was excellent.

When I built my Sierra, the manual came with a nice tutorial on how to wind them easily. I quote, "grip the core on it's left side, pass the first turn over the top, then pull all the wire through, winding from left to right". You hold the core in your left hand, they provide a diagram, the first turn is brought up around the outside of the core, then pushed down the center of the core. I don't know how you can tell which part of a donut is the left side :), but the idea is to start on the left and wind to the right. They calculate all the wire lengths for you. The most frustrating problem when doing this is losing count. I wind them with a pencil and paper in front of me and make a mark after winding each turn. Once you get a ''knack'' it'll go pretty easy.

the HC4046 will do a pretty good job of squaring up a low level sine wave up to 30MHz. I use one on the input of my standard frequency distribution box. I don't know if it will go down to as low a level as you need however, you will probably need an extra gain stage.

May 97 QST has the details on page 37.

In to pin 14 thru a cap
pins 16 3 5 to +5V

You need a tubing bender. Think about how an electrician bends conduit. The electrician has a tube bender. That's how you bend 1" dia. steel or zinc coated, conduit into 90 deg. corners to fit into attics and other places in the wall, house, etc.

Some say to fill the tube with something. This wont work. If anything it'll make bending the tube very dificult and you'll still get kinked corners.

...

I don't think you can do it without kinking it.
When my house was built in 1984, the plumbers used copper pipe on rolls
under the slab. They were able to unroll large diameter tubing, and not have
any joints underground to worry about. Why not try getting some of this
stuff from the local plumbing supplier?

OK, folks...it's time to do some serious lobbying of the two top movers and shakers if you want to see LPFM created. Here's what must be done. In addition to your own Congressman and both US Senators, we need to educate these fellows on the merits of LPFM and why it should be allowed to be created by the FCC. These folks oversee the actions of the FCC and we need their support! When calling ask to speak to the legislative assistant (L.A.) who advises the Senator/Congressman on telecom issues. If you can't get through to the Senator/Congressman directly, this is the person you must persuade of our goal of LPFM creation. Email, call, write letters and follow up with faxes. Always be polite and courteous even if you disagree strongly with their positions when speaking or writing these folks.

SENATOR JOHN McCAIN (R-AZ):
Chairman of the Senate Committee on Commerce, Science and Transportation
As Chairman of this powerful Committee he has direct oversight of all FCC matters. It has been said that he will not support anything that the NAB opposes. We need to educate him on why Low Power FM needs to be created and what benefits it can bring to America. You need to write, fax, email and call his office and tell them you support creation of a Low Power FM service.

Here is a website with McCain's addresses and phone numbers:
http://www.capweb.net/classic/State/AZ/Member.morph?memberCode=S105AZS1

Senator John McCain
Washington Contact Information
241 Senate Russell Office Building
Washington, DC 20510-0303
Phone: (202) 224-2235
Fax: (202) 228-2862
Email: senator_mccain@mccain.senate.gov

Here is McCain's website where you can read his speeches and get a feel for what he is about.
http://www.senate.gov/~mccain/

In the US House of Representatives-

CONGRESSMAN W.J. BILLY TAUZIN (R-LA):
Congressman Tauzin serves as Chairman of the influential House Telecommunications Subcommittee in Congress, which has oversight of all FCC matters as well. His support is also necessary for LPFM to be created. You need to write, fax, email and call his office and tell them you support creation of a Low Power FM service.

Here is Tauzin's website with his contact information and some
background info.
http://www.house.gov/tauzin/
Please address your concerns to Billy at one of the addresses below.

You can E-mail by clicking http://www.house.gov/writerep/
W.J. Billy Tauzin
Washington DC Office
2183 Rayburn House Office Building
Washington, DC 20515
Phone: (202)-225-4031

Here is a good website with more info on Billy Tauzin. Check it out
before contacting his office.
http://www.capweb.net/classic/State/LA/Member.morph?memberCode=H105LA03

Representative W. J. (Billy) Tauzin
Washington Contact Information
2183 Rayburn House Office Building
Washington, DC 20515-1803
Phone: (202) 225-4031
Fax: (202) 225-0563
Email: http://www.house.gov
URL: http://www.house.gov/tauzin/

If you don't take the time to contact these people then you cannot
consider yourself a serious supporter of the LPFM movement. No excuses!
Just do it and get as many others to do it as you can. That's what you
can do to help create a LPFM service for yourself and others. Tell them
that you want to see a LPFM service created as outlined in RM-9242 or
with whatever changes you'd like to see. If you don't do this, you have
let down the LPFM movement and yourself. If we can muster enough
support, we can have LPFM...it's that simple!

Let's tell them what we want them to do before the July 24th deadline
for reply-comments at the FCC. Chairman Kennard cannot do this
alone...he needs your help!

Fightin' the fight for LPFM,

Rodger Skinner
RM-9242 Petitioner

5911. looking for RDF Project Article...

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-18 00:00:00 UTC
From: Alan <alan@xmission.com>
Message-ID: <6makc6jud1@news.xmission.com>
Source record: 82060

Hi everybody,

I’m looking for sources for a type of radio direction finding system. I think I saw a project or how-to article in QST, 73, or other Ham magazine many years ago. The system supports four antennas and a common ground plane, which are used to simulate a rapidly rotating dipole by means of switching.

Here’s the theory: Imagine a dipole array rotating at, say, 500 rpm, so that each antenna is moving towards, then away from, the signal source. Due to Doppler effect, each antenna sees a signal with an added 500 Hz FM component (small amplitude, maybe, but still there). A comparing circuit checks exact array rotational position against the resulting audio generated by the FM receiver, which extracts the 500 Hz information. This circuit drives an indicator which shows the direction the antenna is traveling at the moment the audio sine wave is at its steepest rise, i.e. when it is traveling straight toward the signal source.

This old army (I think) system was superceded by a rapidly switched static array using four antennas. At least one company markets a very high quality system based on this principle. The article I recall included schematics and parts list, and the project built a display with 8 LEDs in a circle as the direction indicator. It was a simple circuit with an audio input from the radio and four RF (antenna) inputs, and one RF output to the antenna jack for the radio or scanner. There was even a good diagram for setting up the four ¼ wave antennas on a common ground plane on the roof of a car.

Anyway… (sorry to be so long-winded)

I’d love to find a copy of that article, or one like it, because I want to try to built such an RDF! Anyone who knows, remembers, or suspects what a source might be, please let me know via email. Once I know where the article was, I can get to work trying to locate a copy. Thanks for reading such a long post, and thanks for all your help!

-Alan

In my continuing quest to get on HF in very tight quarters, I have been researching magnetic loop antennas, using Reg Edwards's(?) fine modeling software for this purpose, and am almost ready to begin construction save that I need to either find or build a variable capacitor that will tolerate at least 5KV, 7KV ideally. The only things I can find that will accomplish this purpose seem to be vacuum variables. Sure, they will handle 15KV at 50-1000pF, but I am not going to spend $300 on one, thank you. ON4CEQ has plans for homebrewing a butterfuly air var cap to spec on his web page, http://gallery.uunet.be/ON4CEQ/ant_en.htm, and says he knows of some who have used double sided copper clad PC board for each of the plates. I am a little skeptical that PC board would work, as each plate would itself form a capacitor, with the board material being the dielectric. I would like to try this kind of consstruction, because I don't have access to power tools that could jig aluminum or other metal for the plates. Please, suggestions or advice on this or other homebrew HV variable capacitors?

You could try a high speed comparator. Like the Linear Tech LT1016 or
some of the Maxim parts. That's what one of the Florida based counter
companies (Optoelectronics or Startek) used as the front end of one
of their handheld units (in a project article in Radio-Electronics).
There's a propogation delay, but there would be in discrete amp, too.
You might want to stick a little gain in front of it, just to keep

Have about 40 used 6 and 7AH 12 VDC gel cells for sale. Also have
about 10 4AH 12 VDC cells. All load tested good. PERFECT for QRP rigs
and portable operation. I have sold hundreds of these to the QRP boy's
on the QRP mailing list and all have been very satisfied. Had a few
damaged in shipping and one came back DOA which I replaced for the
fellow free of charge but that's it. I am the service manager for an
alarm company and we change our customers batteries every 3 years as
preventive maintenance. These used cells should provide another 2 to 3
and probably longer service if used and recharged properly. Cells come
fully charged and are ready to go. They can be recharged with a simple
wall wart charger available at Radio Shack or a 1 amp automotive
charger. I guarantee against DOA.
Brands are Yuasa, Interstate, Radionics and Portalac.

4 ah cells are $8 shipped CONUS
6ah cells are $10 shipped CONUS
7ah cells are $12 shipped CONUS

If you buy 2 of the same I will knock $3.00 off the total price.
Images of the cells can be seen at:

5917. PIC TNC Firmware

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-19 00:00:00 UTC
From: kb8rco@aol.com
Message-ID: <1998061903213800.XAA24004@ladder03.news.aol.com>
Source record: 81999

I want to build a SIMPLE packet TNC to connect to any serial device. The output of the TNC will be RS-232 compatible and formatted in standard RS-232 data format (com1:1200,n,8,1 = 1200 baud, no parity, 8 data bits, 1 stop bit). Anyone know of any PIC firware (or Motorola, Intel 87C51, or other micro controller) that will decode packet signals direct or through a modem chip (3105 I believe is the 1200 baud chip) and output RS232 data to the serial port.
Baycom uses the modem chip (to decode tones), but the packet data is not formatted for the RS-232 port (ie 8 data, 1 stop, no parity). The data comes into a non-standard pin (not data-in) and the BayCom software decodes it with timing, etc.

Any help would be appreciated.

I looked at that stuff when in a hardware shop when I wanted to build a
magnetic loop antenna. I thought it was too expensive.

So instead I got 3 lengths of 3x20 mm flat aluminium two metres long.
When bent (which was very easy being flat) I had a 1.5 metre square loop.
Of course there are disadvantages (need for good connections between
aluminium pieces and lower conductivity of aluminium) but I've still had
success when using this antenna indoors with an 80m QRP CW rig.

Full construction details appear on my Projects Page (URL below).

Nearly correct. This was the first design. It only worked up to 15MHz,
but the newest design with better input network works from 1.6 to 30MHz.
It was published the in "FUNK" (issue 2/98 to 6/98), which has 'bought'
"BEAM" some years ago. If You are interested, I can send You photocopies
by $nail mail.

5924. Old RCA service books and tubes for sale

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-19 00:00:00 UTC
From: Scott Valler <Scott@valler.com>
Message-ID: <6mdktg$6b7$1@news.sunflower.com>
Source record: 82006

Hi - I'm not sure if this is the right place, but it sure looks like it. I have a complete set of RCA Victor service notes for all models from 1929 to 1939 including complete schematics and component values. I also have a complete set of tubes for a RCA 1927 Radiola-18.

I will only sell each as sets. Please make offers. I would just like to get rid of them, but would like to get a fair offer.

I would be willing to sell copies of the schematics for a very nominal copying fee, if all you need is one or two.

Thank you,

Scott Valler

One option is the trombone type capacitor described in
'A Homebrew Loop Tuning Capacitor', Bill Jones, QST,Nov 1994, pp.30-32
This design was for a capacitor for loop to handle 100Watts.

Also check out GW0TQM's magnetic loop page at:

I haven't tried this technique, but am told it works....

Solder a cap on one end of the tube. Dense pack (vibrate) the tube
with fine sand. Solder a cap on the other end (no gap to sand).
Carefully bend... An electrictian's conduit bender would help. The
sand is supposed to keep the tube from collapsing. Unsolder the caps,
empty the sand.

On German rallies are offered home-brew looking variable capacitors with
aluminiumplates and plexiglas end plates, they are assembled using long
screws with nuts between the plates. The problem is to make many equal
aluminium plates, one type for the stator, another for the rotor.

>Will White, KD7BFX

Will, you can short out the dielectric by soldering copper foil around the edges of the boards, connecting top and bottom. Copper rivets, soldered top and bottom can work too. But to withstand high voltages, the plates must be very smooth and free from burrs. That generally means the rivet technique is unsuitable. The solder seams have to be very smooth and clean around the edges or the capacitor will arc at a much lower voltage than the plate spacing would otherwise support.

Besides the butterfly, the other capacitor form which is suitable for this project is the trombone style. This can be made from copper pipe with teflon sheet or tape as the dielectric. There have been several articles in the magazines about constructing this type of capacitor. It is easily motor driven without the extreme reduction ratios needed for the butterfly style.

Since the bandwidth of the magnetic loop is so small, you need to be able to tune the capacitor in very small increments, and you need to do it every time you change operating frequency. So a gear reduction and motor drive are very desirable. This gives the trombone style a strong advantage since it adapts so easily to motor drive.

5937. Might Midget RX update

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-20 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <358bb9a6.164781316@news.erols.com>
Source record: 81922

A number of us are building Lew McCoy's Mighty Midget receiver (April 1966 QST). Here's an update on my version:

I put the front panel on my Mighty Midget RX today and noticed a BIG improvement in frequency stability. I have the main tuning cap very solidly joined to both the chassis and the front panel - I can now hit the table with my fist without any frequency change. Annoying hand capacitance
effects have diasppeared also. For the panel, I just put a false front over
the original Heath Sixer panel and drilled a few new holes. I made the false front out of some very light aluminum sheeting material they sell in the storm door secion of Home Depot. You can cut the stuff easily. Worked great in this application.

I'm not using a reduction drive - but the main tuning cap seems to work pretty well without one. Even SSB signals are pretty easy to tune in. I still haven't got the crystal filter working properly, but I'm growing fond of the 455 kc IF can that I've put in as a substitute. It's pretty broad, but the phone signals sound great and I can do some very pleasant shortwave broadcast listening on 40 meters in the evening. Since I was planning on using this RX for 75 and 40 AM work (with my DX-60B) maybe I'll put off the crystal filter for a while... Any estimates of how wide my
bandwith is with two 455 kc IF transformers as the only selective elements
in my IF chain? BTW, this might turn out to be the solution for those who
are having trouble finding crystals... Maybe we could just arrange to switch
the crystals in when more selectivity is needed and use the 455 kc can (alone)when we want to listen to a broad chunk of the ether

Getting the ganged capacitor in the RF Amp and convereter to track properly
was a bit of a chore, but with the use of a couple of trimmer caps, I think
I have it right.

Wish I had more audio output.

This is turning out to be be a very FB project. I think my 20 meter CW
solid state rx with 3 pole filter is a better radio, but this Mightly Midget
tunes all of 40 and all of 80 and is wide enough for the phone sigs.

And of
course there is something magical about the tubes. All that hardware
sitting on the chassis just looks good! Even the pill bottle coils
look
very cool.

How are the other MM projects coming along? Is there an Italian
version
under development?

And if you are going to use some heat to help the bending, make sure
that the sand you put into that tube was dry ! If the sand is wet and
the caps are tight, the water will evaporate and build up some
pressure inside the tube. Getting the cap in your head during the
bending or unsolder process is not very nice.

Getting that crystal filter to exhibit anything like flat-topped selectivity with a top width anything like the marked frequencies of the crystals will be hit or miss, and almost certainly miss, with that circuit -- because it wasn't actually *designed* to work right. From the late 1950s through the appearance of the mighty midget, you can find similar "push-pull crystals across a tube's plate inductor" filters in a number of ARRL publications (the "2X4+1 Superheterodyne" has one at 1.7 MHz; another receiver had a couple in succeeding stages at about 4.4 MHz). None of them take into account particular I/O termination or the crystals' pole-zero spacing; all seemed to have been built in the belief that whatever filtering results has a top equal in width to the frequencies marked on the crystals. And so far as I know, the performance of none of those filters was *measured* with equipment capable of really characterizing their response shape and loss. What builders probably experienced was an overly lossy response with unequal peaks. To the untrained ear -- and without AGC -- this probably sounded like good CW selectivity. Depending on its loss, such a filter *may* have been worth using. But not with only one IF stage and no attention paid to termination.

You can find a somewhat updated version of such a filter -- for 1.7 MHz, at the output of a dual-gate MOSFET mixer -- in Hayward and DeMaw's *Solid State Design for the Radio Amateur*. Computer-simulated using realistic crystal parameters, it works just as described above. That is, *it doesn't work.*

> Since I was planning on using this RX for 75 and 40
>AM work (with my DX-60B) maybe I'll put off the crystal filter for a
>while...

In listening to your favorite sections of band with very wide selectivity, you're experiencing what many newer hams may never hear with a store-bought radio: A wonderful EM analog to the sounds of a forest, out of which your

brain's ability to aurally select and focus on particular pitches and cadences can copy almost any CW station audible. It's a great thing to have on while you're doing housework or browse-reading within earshot of the receiver. Kinda like being able to look out of your kitchen window and see down all your block's backyards at once.

>Any estimates of how wide my
>bandwith is with two 455 kc IF transformers as the only selective
>elements
>in my IF chain?

The IF subsection of the receiver chapter of ARRL Handbooks of the late 1950s and early 1960s had a table that gave nominal bandwidths at various IFs versus number of stages.

>And of
>course there is something magical about the tubes. All that hardware
>sitting on the chassis just looks good! Even the pill bottle coils
>look
>very cool.

Turn out the lights, look carefully at the tube envelopes, and you may see little patches of blue fluorescence at spots where the cathodes' electron stream has managed to miss the plate and strike the glass. In a gain-controlled tube, these patches may shift in shape and position as you adjust the gain.

Won't the rotor shaft and stator rods and spacing washers tie the two sides of the plates together so that they appear to be solid electrically?

John,

Any of the current rigs (from 1980 on) should work fine for Pactor. I've used a Yaesu 101, Icom 730 and Icom 735 with excellent results. Nice thing about the Icoms is their auxiliary audio jacks in back so you're not always having to unplug your mike.

You should be able to run any TNC with Linux as long as you have a standard terminal communications program. I don't know if the proprietary software, designed for TNCs, will work with it though.

Good Luck.

Radio Randy

My brother (KD4OKI) was able to obtain some 1" diameter soft copper tubing in
Florida for his mag loop, so it must be obtainable in the USA, though I've not
found a source for greater than 3/8" diameter in the UK.
This is just by the way --- the other options suggested are also known to work,
or if you can find a plummer, they usually have a machine for bending copper
pipes in no time at all.....73 -------- G3VBV

Get a Motorola MICOR squelch IC Model M7716 (new version)...
available at a Motorola TWOWAY shop (MSS) only...NOT a Motorola
IC parts house.....takes audio in and gives you fast/slow squelch
out...costs is about 12 bucks (needs some extra parts)...
OR use an op amp with RC filtering looking at 7-10 Khz....
detect the noise with a reverse biased diode (with the squelch pot
setting the bias) and that would work....there are other ways to
do it also...some cheap with discrete ckts...but all you need
is a HP filter to pass only the high end noise (7-10Khz) then
a rectifier and a comparator or similar switch....

: Carefully bend... An electrictian's conduit bender would help. The
: sand is supposed to keep the tube from collapsing. Unsolder the caps,
: empty the sand.

And if you are going to use some heat to help the bending, make sure
that the sand you put into that tube was dry ! If the sand is wet and
the caps are tight, the water will evaporate and build up some
pressure inside the tube. Getting the cap in your head during the
bending or unsolder process is not very nice.

Paul OH3LWR
>>>>

Just a thought, and I haven't tried this either. Perhaps it might
be a good idea to drill a very small hole in at least one of the end caps
to allow steam to escape in case there is some water in the sand and
heat is used. Again, I have never done anything like this, just a
thought to consider. The idea of the loop antenna does interest me
however, and I am happy that this discussion has been kept on
the list.

I realize this may not fit into the group but I am not sure where to get
this info.
I have a FT-101 that is having problems, the power transformer gets VERY
hot when the
radio is just receiving. It gets so hot I had to turn it off because I
could smell it, I did not try to
transmit.
I have taken a few ohm readings on the power connector on the back of
the radio
all reading are to ground, # 7 is ok for sure it is the gnd pin. The
ones I am really concerned
about are the .1 ohm readings especially pin 9
Does anyone have any data or know if these reading are ok.
any info would be greatly appreciated please answer here or if you can
Email
me directly at jeffd@feist.com thanks again!

I have know idea about Class E and packet use, but last year QST ran two articles in consecutive issues on brewing a 40 M 500W Class E. I looked into the parts list, and it can be done for less than 50 bucks. Unfortunately, the design calls for keying the power supply, rather than a key line from the exciter to the amp. I'd like to figure out how to make a Class E keyed in the conventional way. Any pointers? Also, has anyone made a broadband, at least 2 band (40/20), Class E?

Hi Peter. I build all my own keys including bugs. I like to use relay contacts. You can drill out a screw head or the end of a screw, melt some solder into it, float the relay contact on top, and level it with a knife blade while it cools. Works great. Then just drill and tap the hole for a screw and you have an adjustable contact. Relay contacts are usually silver or a silver alloy.

5954. Wide Band Noise Source

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-20 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <358C1E88.297A9A03@lafn.org>
Source record: 81939

I wonder if I can get some circuit assistance with a HomeBrew low cost
Wide Band Noise Source I am trying to build with not very good results.

Noisecom.com prices for noise generators and components
are a little too expensive causing me to try a design of my own.
Could it be that the task is so complex it is best to buy a
Noisecom diode source and add my own MMIC
amplifiers? Suggestions are welcomed.

Need 5 mhz to 1000 mhz, 50 ohm Zout.
Are several noise generators are needed for full range?
This is a homebrew task to use with my Poor
Man's Spectrum Analyser.

First attempts to feed 6v zener diode from +12v,
limited to 2 to 5 ma, AC coupled directly into UPC 1651 MMIC,
caused MMIC to oscillate 400 to 800 mhz rather than produce noise.
Zener mode does not look like 50 ohm source to MMIC input.
Not sure if layout difficulties or not 50 ohms source is causing
oscillation? UPC1651 MMIC seems touchy regarding layout.
Are there MMIC's that are more tolerate of poor layout
while remaining stable?

More questions:

What common transistors or diodes are best for noise source?

What is a good interfacce circuit to feed Zener operated as noise source into an
MMIC (MAR11 or ?) to increase power of noise signal?

Which MMIC's are best for this ckt, i.e. are most stable with poor layout.

Are there web sites with some examples or HOW_TO info?

Thanks for any hints,

73, W6MIK

Sounds like what you really want is a Poor Man's Tracking Generator.
:-) What is the first IF of the spectrum analyzer; isn't it basically a
UHF TV tuner? Maybe you could couple some LO out of it with a pickup
loop, amplify *that* with a MMIC or two, and mix it with a
computer-grade crystal clock at the IF frequency. As long as you shield
everything and use absolutely minimal coupling to get the LO signal, it
should be possible to get good isolation.

Hmm. I am not familiar with the UPC 1651 MMIC, but have never had
trouble with any of the Mini-Circuits MAR series oscillating. I believe
they are all unconditionally stable, except for (IIRC) the MAR-8? I've
used a million of them in various things and never encountered any
untoward behavior. Are you building the MMIC amplifier on an unbroken
copper ground plane? That's likely to be the secret, more than anything
else.

> More questions:
>

>

I think you need to attack the poor layout problem, really. MMICs are trivial to use, as long as you (a) build everything "dead-bug" style on a piece of copper-clad board; and (b) especially with low power supply voltages, use a small RF choke in series with the power-supply dropping resistor.

The MAV-11 makes a nice, robust general-purpose amp. Or, really, just about any of the MAR series could be used for something like this, where the levels aren't critical.

> Are there web sites with some examples or HOW_TO info?
>

If you don't have a copy of Mini-Circuits' "RF-IF Designers Guide" yet, I'd snag one first. Very informative book.

I don't know much about noise sources, but you might try the base-emitter junction of a high-frequency RF transistor like a 2N5109? Volume 2 of the RSGB Microwave Handbook illustrates a grounded-base NPN transistor whose emitter is biased through a 10K resistor and RF choke. Output is taken from the RF choke-emitter connection via a 1000 pf capacitor. The author claims it's good to 1.3 GHz, depending on the transistor.

Source record: 81762

Hi
I bought this at Scandinavian VHF meeting in Denmark a week ago. There was no instruction book, only two pages from a General Radio advertisment.
Has anybody any experience with using this bridge? I am not sure, but I believe it was mentioned in G3LDO Antenna experimenters book (at the moment the book has dissappeared)
Does the bridge need any sort of maintenance?
Does it measure R+jX where X is negative (capacitors) and positive (inductors)?
What means INITIAL Balance for X and R, respectually?
the Zx connector is for C-type connector/conversion, the other are BNC, is it easy to modify the C-type conversion to BNC?

QST for May 1994 has an article on a homebrew low cost, high quality noise source. It tells how to have the source calibrated very accurately by the NoiseCom Company for a small fee.

Short lengths of polythene-insulated coaxial cable make excellent high-Q,
high-voltage capacitors.

It so happens that 50-ohm solid polythene insulated coax has a capacitance
of 100 pico-farads per metre regardless of radial dimensions.

75-ohm cable has a capacitance of 67 pF per metre.

Not variable of course but can be used to make large capacitors with a
small value trimmer in parallel.

Hint:- for a large capacitance do not use a long length - use a bundle of
short lengths. This will maintain a high Q, ie, a low series loss
resistance.

Don't tell Uncle Sam, but I've used dimes as contacts. Just file them
flat on the meeting faces. Only cost 10 cents each too! Handles lots
of current for those old cathode keyed radios.

(Of course this was back in the days when dimes were really silver.
You might have to go to a coin collector to find those today.)

You can make a pretty good replacement bolometer head for the 430 series using two miniature 5V bulbs (lamps). Just make sure that they have approximately the correct resistance when they are just visibly glowing. I've got one in my garage but it is 8 time zones away and really it would be easier for you to make one than for me to send this one to you!

Digikey also have a range of small glass encapsulated thermistors of the right resistance range in theit catalog, which I have not investigated but which it should be possible to make a nice thermistor head.

Well, relatively high voltage anyway. RG58 arcs through at about 2500 volts,
good RG8 can withstand up to about 8000 volts. But you have to watch the ends,
the cable can arc across the end gap with less voltage, particularly if there
are any contaminants present at the cut. Dressing the braid back a couple
of inches from the end can reduce this problem.

I used the BE junction of a BFR96 RF transistor with good success.
It has a much smaller capacitance than an ordinary Z-diode and has a
breakdown voltage of abt. 5 to 6 Volts.

Take an SMA or BNC connector, solder 3 220 Ohm resistors across it.
Solder the base of the bfr96 to the center conductor and decouple
the emitter to GND with a 1nF chip capacitor + 100 nF.

Attach a variable current source of abt. 1 mA to the decoupled
emitter. Regulate the current so that the 3 resistors + be junction
look like 50 Ohms. I simply measured S11 with a network analyzer.
Best return loss was at 0.89 mA in my case.

You can skip this if you only want lots of broadband noise and do
not wish to make precise noise factor measurements. If you want
to optimize GaAs-Fet amplifiers you'll need an _excellent_ 16 dB
attenuator after the noise source for matching and range setting.

I measured excess noise with a HP noise meter and got these results:

MHZ dB MHz dB MHz dB

10 21.54 200 21.55 500 22.12
50 21.34 300 21.76 800 22.46
100 21.86 400 21.73 1000 22.2
145 21.48 432 22.04 1296 22.2
1500 20.43

"Excess noise" tells us how much power the generator delivers
compared to a 50 Ohms resistor. These values look pretty flat.
The noise meter could not go higher than 1500 MHz.

The circuit develops a 200 mV DC offset at the output.
It does not hurt if the circuit you feed the noise into

has a dc short as long as your current source does not change
its value.

Do not re-use the transistor for anything else when you did this to it
even for a second. Its beta and noise characteristics will suffer.
A BFR96 costs next to nothing.

BTW i heard that Prof. Zener once sued against the use of his
name because these diodes do not use 'his' effect. They settled
to call them Z-diodes and attribute the name to the shape of
the V/I curve.

A simple and quick fix would be to purchase a twin pack of rectifier diodes from Radio Shack Part #276-1104 for .79cents. On the bottom of the tube socket, solder the cathodes of the two diodes together at pin 7 and connect the other end of one diode to pin 1 & the other free diode to pin 6. Good luck and 73, Paul

I use RG213 for the input matching capacitors for the Uni-Hat CTSVR. They will handle up to 2 KW into the 30' top loaded structure without any problems. I terminate these capacitors to the antenna with #10 wire lugs and seal them with a combination of special heat sealant and shrink wrap tubing. Nominal capacitance values for 160m is 150 pf (31"), 80m 70 pf (14.25"), 40m is 35 pf (7.0"). The end of the coaxial stub is fitted with a UV treated PVC end cap and sealant to keep out moisture. 73, Ed - N5NUG

If anyone has a service manual for the Tek 2215, he could help me by looking up Q222; I need to know the physical location and ideally a generic part number. I picked up a beater scope and it has a tag saying Q222 is missing; don't know its function, but channel 2 does not trigger so I'm guessing it may be related. Also, if there is another transistor of the same part number I would like to know that 'cuz I have an (incomplete) parts unit that I got the CRT out of.

Would really like to fix this one, it's a nice little scope but I would prefer both channels working.

A source at our finger tips for High Voltage caps,,, is the defunct vacuum tube.(thermionic valve) As they are in a vacuum they handle extremely high voltages, and are often low in value...making for good fixed tuning caps....for example in old pentodes..the interelectrode capacitance is sometimes as little as 10pf. or as high as 200pf..
I use them often at high powers and never have any problems...
Necessity was the mother of this...here in Vk vacuum variables cost the earth!

maurie.
VK3CWB.
Food for thought.

>
> Curt M. Breneman

Frequency-wise, it should be fine, but I recall that the upper power range for the thermistor bridge sensors was 10mW. I'm really more familiar with the later 432 model. You'll need some attenuators to extend operation to higher powers, but given good attanuators the thing is capable of very high accuracy.

It isn't a throughline instrument, like the Bird 43. Think of it as a VHF to microwave QRPpp dummy load with super accurate power metering.

Cheers
David GM4ZNX

Source record: 81773

Got a 3x813 1KW PEP HF PA that need new filament/heater gear,
I have not been able to locate Vmin/Vmax for the 813tube regarding
heater voltage,
I have heard that heater voltage below Vmin will damage tube(shorter
life) and also PA linearity.
My query is: will the 813s dislike 9.4VAC - or: what is Vmin ?

I have a beautiful 15A/10V toroidal transformer but the losses in the
filament choke and voltage distribution means a 0.6V reduction. My
alternatives are to change transformer (not good for me) or to oversize
voltage distribution wires and get very close to 10volts at the tubes,
the third option is to go ahead with 9.4VAC and watch the results....

If I remember correctly, the spec was 10V, +/- 5%, with overvoltage
being more acceptable. Turn-on surge should be limited to a 1V swing.

Pick up "Antennas" from Rat Shack. Fairly good primer on antennas, though they plug their own products, of course. There is enough info to construct several different antennas on your own, for various applications.

Benjamin, I doubt very seriously if you could build one cheaper than you could buy one, the only things I've built for TV has been a 4 element yagi for channel 6, the other was build a rhombic but the space required is huge, the length was about 120 ft. if my memory serves me. It was quite remarkable however and really did a super job. A rhombic by the way looks like a big long diamond with a terminating resistor at one end, I never had the equipment nessesary for actually measuring its directivity but it did work very well. Post to the group more specifically what your trying to accomplish, long distance? better directivity? or did you just want to build you own for the experience?

Dave somthing I did years ago for some electronic equipment was to use a big block of styrefoam use 1" thick slabs and cut out the 'holes' before you stack them together to fill up the carrying case. Once all the cutting was done (I used a razor blade) I cemented a big sheet of felt right over the top piece and then very slowly cut slits from the center of each cut out to the edge.
I folded the felt down in side the cutouts and cemented it. You can then use small 1" strips of foam, or what ever you please to 'shore up' any oversised holes. This was for some demo equipment that was in and out of the case 5 times a day. I found that this worked much better than some of the commercial 'foam rubber' cases because the equipment slid out very easily, the foam rubber cases that many other vendors provided were always cut too small making it difficult to remove the equipment.

Will OM,
Fairly high voltage variable capacitors can be made using foil-covered window glass plates sliding on top of one another, one stationary and the other one being moved by motor drive, with fishing line winding up on the motor's extended shaft. Judging by your modest voltage requirement, I assume you will not be running over 100 watts.
You can also make your own plates and build up a large air variable, figuring about 20-25KV per inch of spacing, if the plates have nice smooth rounded edges. Labor intensive, but like many labor intensive projects, can be VERY cost-effective. Make the plates out of solderable material, as the common bolt-and-spacer type of construction is not acceptable for small loop-tuning capacitors due to high RF resistance of all the pressure-only contact joints. Remember, the skin depth at 10 MHz is only .001" (1 mil).
This will not help you much, but I found a 50KV Jennings vac variable for $200, which I intend to use in a 1 KW electrostatically shielded loop for 20/30/40 meters. You might keep your eyes peeled for a smaller vac variable from a private party. Forget the ones at Surplus Sales of Nebraska or other places; I think they use new list prices!

Hi Will OM,

Class E amplifiers have been around for 30 years or more. With new devices, they become more practical. If you review the QST articles on the class E amp written by the guys at Cal Tech, you will see that it (like all Class E amps) relies on a series-resonant output circuit to deliver power. Hence, it is not a broad-band design, but a narrow-band tuned amplifier. Make one for each band, or switch or plug in tuned elements for each band.
As for keying the amp, the best solution I would think is to use an off-line switching power supply (homebrew one or modify an existing one if you can find it. This also allows easy variation in power level without using expensive large components such as a variac). Then, key the power supply switching controller circuit to interrupt the power. Might be difficult to get the keying waveshape just right however. You could also homebrew an active device switch that would directly interrupt the DC power, using an appropriately rated power MOSFET for the switching device. This approach lends itelf to optimizing the keying wave shape (rise and fall times).

Dave OM,

I built one of the noise generators described in QST for May 1994. It is an excellent useful device to have when testing receivers, etc. I bought the noise diode from Noise/Com, and sent the finished unit to them for calibration, as per the article. They calibrated it and sent the calibration data (both excess noise level and SWR) back to me with the unit, as well as an affixed sticker verifying calibration (gosh). I think the diode was $10, and the calibration was, what, $25? cannot remember. All in all, a worthwhile investment for a laboratory grade noise source. You can also calibrate other sources from it.

I can understand the desire, but today I bought a TV/FM antenna at a Radio Shack clearance price of $3.97 {SKU 15-2159}. The cardboard carton would cost more than that!

However, Radio Shack will sell you its antenna book for about $6.95 with complete instructions for making your own TV antennae.

By the way, I went to the Shack to buy a couple of the inverted-V multi-band SW antennae for $1.97 {SKU 20-181}. Bought five.

Go to:

www.microchip.com

Microchip makes available for free the MPLAB assembler/development system. I'm not sure, but I think they still have a "crippled" version of a C compiler (crippled in that it only created a program of up to 256 words long...) available for free, as well.

For over a year, I have used (and been pleased with) the CCS C compiler - in its DOS version, it is as cheap as $99, and is available to support either the 12 or 14 bit processors. As for programming, follow the links from the Microchip page and you fill find *dozens* of programmers available - some of the ones that do the 16F84 contain less than a dozen components, but most are very easy to build - the schematics and programs are available online for free...

Hello to all,
I have one Millen Venier # 10035, large knob and 5 line scale. Measures 8 L x 6.5 H inches. THis is available for $ 35.00 US, plus $ 3.00 for shipping.

One National drive unit, new, arc of 180 degrees, with knob in middle. If you have the 1963 Handbook, look in the catalog section on page 31. THis is available for $ 20.00 plus 3.00 for shipping.
Regards,John

6006. Wanted: your recomendations - ssb/cw kits

Realizing that Heathkit is no longer there to fulfill this desire of mine, do any of you happen to have some recommendations on what sort of kits you've built and whether, the price, and who sells them.

I'm interested in a kit that would be easy to trouble shoot (if necessary). I know NORCAL has a 'multi-band' kit. Does anyone else? Does anyone sell a ssb kit (mono- or multi-band?)

Right now, I'm thinking of maybe getting the Ten-Tec 30 meter QRP/CW kit. What do you think of this kit?

I'd like all of your input! (just send it my address as follows...

aa0ni@yahoo.com

If you just push reply, you will end up sending it to my dad's mailbox that I'm using now - and I don't think he really wants to read your recommendations.

THANKS!
Daniel/AA0NI

I have seen a number of articles suggesting this technique, but there should be
nothing wrong with using single-sided PCB either.
For a 40m loop, I used a variable I had lying around, max was 7 watts SSB and I
worked all over Europe with it indoors. My 80m loop uses a Vacuum cap picked up
at a rally for 20.00 GB Pounds, it worked well till the motor died and my new
motor is too slow, so I shall have to devise another method of driving it or get
a faster motor..... 73 ..... G3VBV.

>
>73 Chris SM0NCL (remove ' NOT' from replyaddress)

Hi Chris,

According to the RCA data on 813, I understand that the filament
current is the critical one. At a filament voltage of 10V, the current
shall not be less than 4.7A and not more than 5.3A. That means that
the filament power can be anywhere between 47 and 53 Watts. Try to
find out what you have. To much will burn out the filament too soon,
and too less will destroy the cathode layer. You can choose freely
bwtween two evils.
(I have many transmitting valves, also NOS 813, in stock)

Best regards,

Arnold Goks&#65533;yr

Where can I buy the Mitsubishi M57716 power module?
I live in Sweden so if there were some place in Europe it would be nice.

I tried at TDC in the UK, but the did not sell these modules anymore.

Or perhaps someone has something useful in his junkbox?

>components, but most are very easy to build - the schematics and programs
>are available online for free...
>
><Clint>
>KA7OEI
>

I've been using MPASM which is available free from the microchip website to program in the Microchip assembly language. I write the assembly language programs with my DOS editor and assemble them with MPASM in DOS. It's very easy to learn in an evening - much simpler than the Z80, 8051, etc instruction sets which are 4 or 5 times the size of the PIC instruction set.

I have a Needham's Electronics EMP-10 programmer, which will do the PIC16C54, 55, 56 and 57 devices (as well as most EPROM's, many EEPROM's, 8751's, etc.) I've been thinking of getting one of the other programers to do some of the other chips such as 16F84 (Flash memory) now that I have my feet wet.

Check out www.microchip.com. There's a lot of data available there. There's even a design for a rotor controller, complete with schematic and assembly-language program.

(I don't work for any of the above companies but have been a happy customer so far. Needham's tech support is astounding!)

An old J.W. Miller catalog says:

Resinite Adjustable RF coils
Phenolic impregnated tubing for high dielectric strength, moisture
resistance and non-corosive properties. Maximum inductance is +/- 5%.

Miniature Adjustable RF coils
Size: 1/4" dia. x 13/16: lg., form.

20A687RBI:
minimum L: 0.508 uH @ 25 Mhz, maximum L: 0.816 uH @ 25 MHz
minimum Q at L: 72-50, DCR: 0.082 ohms, maximum I: 635 mA.

20A827RBI:
minimum L: 0.735 uH @ 25 Mhz, maximum L: 0.984 uH @ 25 MHz
minimum Q at L: 57-41, DCR: 0.090 ohms, maximum I: 635 mA.

The above use form: 20A000-0

Economy Adjustable RF chokes
Adjustable from either top or bottom; ferrite core. Mount by metal
clip in 5/16" round or keyed hole. Size: 3/8"" dia. x 1 3/8".

4204:
Inductance: 5-12 uH

The above uses form: 4200-0

6020. Recommendations for Legal Limit Amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-23 00:00:00 UTC
From: Robert Fanfant <fanfant@ix.netcom.com>
Message-ID: <6momut$pub@news.microsoft.com>
Source record: 81806

I would like to build a legal limit amp using the 8877. Since this is going to be my first "big" project, am I biting off more than I can chew?

I'm looking at the 1993 ARRL handbook 160-10m amp but that design doesn't cover all the amateur bands. Are there any other designs that you know of that do?

Would like comments from those that have/haven't(i.e. failed) built their own amps and what problems did you encounter?

What recommendations do you have for the chassis? Am I better off trying to find an older amp and shoehorn my design into it? I'm concerned about the sheet metal work since I'm not equipped for that.

What recommendations do you have for finding the required parts? I plan to first build the 3.kV power supply. Need sources for used Hipersil transformer, caps and hi-powered relays.

Any and all comments will be appreciated.

-rob N7QT

There are several (fully functional) free c compilers out there. There are several on oak at ftp://oak.oakland.edu/pub/simtelnet/msdos/c/ and also I found one at http://www.hitech.com.au/products/pacific.html. These are only a few, I think there's a version of gcc out there as well, and I've heard of one specific to PICS but I'm not sure where it is... search engines are your friend in this case. It's amazing how much free software there is out there.

Cheers,

Stephen

Hi,
It is not the permittivity of the glass that you need, it is the
dielectric constant.
According to my 1961 ARRL Handbook (you'd be surprised how often it
comes in handy

doing today's design work), the value for window glass ranges from
7.6-8.0. In
any event, you can easily measure it at the frequency of interest, by
the substitution
method if you feel you need an exact value. I would just assume a value
of about 7
and test accordingly.
This idea (like most good ideas) is not new; it has been written up
several times over
the years by others. The most recent article I think, from memory, was
within the last
2-3 years in CQ magazine.

73 and GL,
Don, W6JL

6025. Re: Info pse: Ark QRP kit

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-23 00:00:00 UTC
From: Bob Lewis <aa4pb@erols.com>
Message-ID: <359001B5.BE53478E@erols.com>
Source record: 81811

I've built the ARC4 and the TAC1 (40 meter). Both are well build - not mil spec but suitable for portable use with reasonable care. The parts, even the case (without the labels) are standard items. The mfg (S&S Engineering) will be releasing a new all-band QRP rig this fall.

Does anyone know where I can get the schematics for putting together a United Electronics Laboratories (Model E) Oscilloscope kit. It was given to me, and all of the parts seem to be there, except for the schematics.

This is an old kit, I just don't know what year it came out, can you help with this matter also.

Thank You.

> . . .

The dielectric loss is the same as the relative permittivity, i.e., the permittivity divided by the permittivity of free space (8.854 X 10^-12 coul^2/nt-m^2). (This is actually the real part of the complex permittivity, but the term "permittivity" is frequently used to mean the real part, and "complex permittivity" to include loss.)

Surely this would happen only if the plates were joined to each other.
If, for example, the plates faced each other and the distance between
them alter - probably by screws attached to the reverse of the boards
there would be no electrical connection. Nor with two plates separated
e.g. by a shee of glass and moving boards ove the glass to brimg a
larger/smaller area into contact.

Don't also forget one tube (insulated) inside another other

I have a 1995 Ford Taurus SE...I'm installing several radios, as well as

lights and some other electrical equipment for Ambulance service. (I'm a

first-responder for my corps)

All of it is going through large power feeds to the trunk, and will be operated with relays (a switch panel will be located in the passenger compartment).

HOW MUCH power can I pull of the battery of my car...it has a 3.8 litre (the larger of the two) engine, if that makes any differene, perhaps in the size of the alternator or the current draw of the engine itself.

I will probably need to pull 10-20 amps on standby, which I know is no prob. But on peaks, I'll probably need 30-40 amps. Will my car and batt be able to handle this?!? I have a gold tap right off the batt terminal,

and three ten-gauge lengths of fuel/oil proof wire for the power.

To reply to this message, be sure to remove "---nospam" from the reply-to address. This is insterted to prevent automated mail-spammer "bots" from getting my address and adding me to bulk e-mail lists. Thank you!!!

You might try filling the tubing with finely compacted sand, cap the ends somehow and shape with a form and a torch as before. Sand my prevent the tubing from caving in.

Lots of luck,

Bob, KE6F

Has extended recieve (137-174mhz), and can do mars/cap
after holding the F and DTMF keys while turning on the radio.
Holds 33 freqs (30 standard memories, 1 call channel, and two
VFO freqs). Has two power settings, 45 watts and 10 watts.
This is an automotive mount unit, but can be used in the
home with a 12v 10amp adaptor.
It comes with the hand mic and has full dtmf keys and
some keys for controls on it. Display is backlit with green LEDs.
It does not come with a mounting bracket or origional
manual. But, I have printed out the on-line manual for your
convenience.

It works just fine and has no problems.

Asking $135, or best offer. Remember, the price is open
to negotiation.

I'm selling because I'm currently between jobs and
haven't gotten around to getting my amateur liscense yet. I need
the money more than I need the hobby.

6040. Does a 2m 5/8 wave groundplane need a matching circuit?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-24 00:00:00 UTC
From: Randy Albin <randalbin@hotmail.com>
Message-ID: <01bd9f31$7f03a0c0$0dc809c1@randy>
Source record: 81875

I am building a 5/8 wave groundplane antenna for 2 meters. My ARRL antenna manual does not show anything of this nature. (14th edition) What percentage of a wavelength should the radials be? I have been told that this type of antenna requires a matching circuit and cannot be tuned without one. Is this correct?

I have not had good luck tuning this antenna. My SWR is great on the low part of the band (1.2 - 1.5) but about 146.300 it jumps up to 1.8 and by 148.000 it is up to 2.4. I have shortened the center vertical as much as I dare without more information. The last 4 inches that I removed from it (1/2" at a time) did virtually nothing to the SWR. I now have it pruned to about 48". Changing the angle of the radials seemed to do the most good but I have also run out of options in that direction.

I need an omnidirectional antenna with a lower angle of radiation than a 1/4 wave groundplane can provide. I only have 6 watts RF available from an HT and the nearest repeater is about 15 miles away.
1/4 wave homebrew groundplane up 30 feet works good in nice weather but during a storm (while weather spotting) I can't hit the repeaters. (3 different machines in 3 different directions and all between 15 and 25 miles away).

Does anyone have any ideas or suggestions? I am working on a very limited budget.

73's

Recieves on:
29- 54mhz FM
108-137mhz AM
137-174mhz FM
406-512mhz FM

Has 50 memories in three banks. "Private" bank holds 20
user selectable freqs, "Police" bank holds 20 user selectable
freqs and has a bunch of pre-set freqs that can be locked out,
"Fire/Emg" bank holds 10 user selectable freqs and has has a
bunch of pre-set freqs that can be locked out, "WX" bank does
all weather freqs, and "Air" scans the entire aero band.
Unit uses a mounting bracket, which was lost by the
previous owner. Not included. No manual, but I can instruct on
how to program it. Runs off of 12v DC, power supply not included.
Basically, just the unit itself. But it'd be a great
little thing to keep out in the car or truck.

It works just fine and has no problems.

Asking $70, or best offer. Remember, the price is open
to negotiation.

I'm selling because I'm currently between jobs and don't
use this at all anymore. I picked it up to put it in my car, but
never got around to doing it. I need the money more than I need
the hobby.

The battery can handle plenty of intermittant load. The question is the capacity of the alternator - will it keep up with your average load? If not, you will eventually run the battery down even with the engine running. If the capacity is not marked on your alternator, you should be able to get the info from a dealer or parts supplier. I suspect that your standby current will be no problem but the peak might be, depending on how long you expect to operate at that load.

Nope... ::sigh::

Just another spammer. I was wondering the same thing - why is he posting
something about encryption in an amateur radio. I asked him politely to stop
once, but I never got a response.

DO NOT BUY THIS "DEAL"

First, Radio Shack's got it for $100. Great scanner, PC link, cool stuff.

Secondly, there IS NO KEYPAD TRICK for the Pro-64. I own one - I've looked
around just because I want to prove this scanner scammer wrong.

Just looking out for my fellow hams!

6055. Re: Does a 2m 5/8 wave groundplane need a matching circuit?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-24 00:00:00 UTC
From: tiemann@spot.colorado.edu
Message-ID: <6mr1g6$nd4@lace.colorado.edu>
Source record: 81890

I have read that the 5/8 wave antenna only exceeds the 1/4 wave whip in gain if either there is an infinite ground plane ... all the way to the receiving station, or if there is another 5/8 wave element going the other way, as a 2 x 5/8 wave "dipole".

Perhaps you would benefit from a colinear vertical - this is from August, 1990 "73," p. 10: Make as many electrical halfwaves of coax as you need for the desired gain, with the dielectric trimmed to just 1/2 electric wavelength, and with the center conductor comfortably sticking out. Some of the braid needs to be exposed at the ends too. You also need an electrical quarter wave piece of coax, and a true 1/4 wave whip, and for the feedpiont, a balun. (The article describes a sleeve balun, you could also use a choke or other.)

Starting with the feedpoint, go through the balun, and then connect one of the resulting terminals to the braid, and the other to the center conductor, of a 1/2 wave electrical length coax piece. At the other end of this piece, connect another 1/2 wave piece, but offset so the the shield connects to the center of the next piece, and the center to the shield. Continue adding these offset pieces until you have used them up - how ever many you want. Then connect the 1/4 wave electrical length coax in the same offset manner to the last 1/2 wave piece, short the top end of the 1/4 coax (away from the feedpoint) and solder the 1/4 whip to this point. Jam the whole thing (streched out) into a thin-wall pvc tube for weatherproofing, and off you go!

According to this article, 4 1/2 wave elements = 3.5 dBd,
8 such elements = 6 dBd
18 " " 9 dBd
21 " " 10 dBd

You can sort of understand the operation of this antenna like this: The balun feeding the coax forces there to be current on the outside of the shield. The phase of this RF would switch every half wave electrical length as you go up from the feedpoint, so there would be current up, current down, current up, etc, at a given moment in time as you go up the antenna. These would tend to concel the radiation. But in this antenna, you put every other half wave "inside" so it's the OTHER phase of current on the outside. Now it looks like current up, current up, and current up, etc, as you go up the antenna at a fixed point in time. All these currents add, and there is a large far-field result from all these currents in phase. That is, the antenna has gain.

Good luck.

I did read in an article that ordinary window glass would shatter, but there
was no recommendation as to what type of glass would do the job.
If I could get the answer, this would make construction of a capacitor to cover
the 80m band and perhaps even 160m a reasonable proposition with my 6' dia.
loop. I could also switch in a cap for 160m, first I need to find a faster motor
with gear to mesh with my vacuum cap drive mechanism.
I had been looking at dialectrics and had got some ordinary window glass from a
fellow ham and friend, then I read that article and left the issue there.

If you are going to pull such power continously you will need a very large alternator.

I have seen large installations with a custom dual set of alternators and a secondary battery system. It must work with the main one to be stable. It is a dual parellel system. I don't know the wiring for this, but there are places that do this type of work...

Some of the bigger vehicals use 100 amp and bigger alternators. This may be what you can use. Go to a big auto electric place. They can help you properly...

I knew that sounded too good to be true (at least for the majority of
us)... ;-)

Called a local Radio Shack and they did indeed show a price of $1.97
for the antenna. But they're out of stock and can't get any more, and
no store in the Kansas City area has any... So if you can find them
locally, they're worth the price even if all you want is the wire...

My mistake, my appologies. I accidentally typed in "64" when I
meant to type in "46". I made a mistake and didn't catch it until you had
corrected me. I own a pro-64 too (which is not for sale) and this is
where my little boo boo came in. Besides, the 64 had 400 memories, and I
said that mine had 100, so most intelligent people would have caught my
little boo-boo too.
It is a pro-46 for sale, and /not/ a '64.

> Just looking out for my fellow hams!

And it's well appreciated. I might have not caught it if it
wasn't for you. I might have had a really pissed off customer.

>mistakes.

You didn't offend me. It is preferable to get a little flaming
for a boo-boo as opposed to accidentally delivering the incorrect product
and having a dissatisfied customer.

>>BTW: I love the Pro-64. The best $150 I've ever spent. I also bought an
>>HTX-202 (great ham xcvr!) for the same, so that's another $150
>>well-spent.
>>Radio Shack service is very bad, but most products are pretty good.

I love it too. It's relatively fast, triple conversion is great,
it's compact, etc, etc. Best $100 I ever spent.
I had a hard time finding it at that price too, had to have the
manager at the store drive up to another store and pick one up. Service
may be bad from HQ, but service is pretty good when dealing with that at
the store. It also helps to know the manager personally. ;)

>>If ignorance is bliss, why aren't more people happy?

They generally don't take enough drugs. :)

Hi all,
I would like to start back on CW QRP after many years. I used to homebrew a long time ago. My knowledge has gotten a little rusty. I am looking for the following information.

1. I am planning to use a 3W TX on 20m to begin with. I will later on add a 40 m QRP. What kind of antenna can I use so that I can maximize the actual transmitted power. On reviewing antenna basics and assessing space constraints I can either put up an inverted V, or some sort of a long wire antenna along the gutters on my house. A flagpole vertical is also a possiblity. So my question, what would be a good ant for QRP from the types above and any related designs?

2. I would like to put as low loss a transmission wire as possible (cost permiting). The local ham store sells RG213 for .36 per foot and LMR400 for .59 per foot. Is the LMR400 worth it over RG213 as far as QRP work is concerned ? Also I am estimating a cable length of about 50feet. Is this too long for 3W CW ? Should I restructure my shack to shorten the cable length ?

3. Do I need a 1:1 balun if i use a inverted V antenna with the above mentioned cables ? Can I just use a connector and hook up the cable directly ? I am asking this from the point of view of loss.

4. Is there a lot of activity in the 80 m band in CW QRP ? Is it worth considering designing a shortened 80 m antenna ?

5. How do wave (antenna) traps work with 3W CW for multiband antennas (like inverted V) ? Has anyone used a wave trap for QRP successfully ? Where can I get details to build wave traps (I have never built wave traps so detailed instructions will help) ?

6. I have a radio shack portable communications RX. Has anyone used this radio for QRP RX. Can I just build a simple crystal controlled fixed freq. QRP TX and use the radio shack RX ? Has anyone tried this setup ?

Please post and email replies to jayarajans@hotmail.com

Thanks in advance for help.

Regards,
Jay Samuel

6088. 5/8 Antenna Mag Mount help...

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-25 00:00:00 UTC
From: Andy <ve1vvv@rac.ca>
Message-ID: <9tzk1.57$ka7.581154@sapphire.mtt.net>
Source record: 81824

A 5/8 antenna usually uses a coil to match the whip to the coax. The center being connected to the tap on the coil, and the ground connected to the bottom of the coil. If you use a mag mount then the bottom can't be connected to ground since you only have one connection for the whip. What do the companies do who make 5/8 mag mounts?? Leave botttom of coil open? Relying on the ground plane to match as in a 1/4 wave?? I ask as I have a 1/4 wave mag mount and I want to put a 5/8 antenna in it's place after just unscrewing the whip.
What to do??
Thanks to all for reading.

GL on that project! I truly believe it is not economically feasible.
I originally became a ham for the exact reason you state, wanted
to get into R/C and found the radio part more interesting.
There is an old design floating around for a tube type transmitter
rcvr with an escapement for control. 1,000 years behind todays
proportional control.
I havn't flown in years because the FCC changed the bandwidth so
Im not up to date but you should simply consider purchasing
one of the better brands.
The reason you can't find anything is that no one is doing it today.

Mike

6092. Audio / Signal detection ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-25 00:00:00 UTC
From: smp@mail.gmtcom.com
Message-ID: <6muuoq$pup@ns.sol.net>
Source record: 81828

I would like to interface my Kenwood TM-742A to a repeater controller...
Actually, it's the NHRC-2 controller
(http://www.nhrc.net/nhrc2/index.html).

I'm using the RD line on the microphone jack for the audio source because
it is selectable and locked to a given band. It is rated at 100mv/10KOhm.

I can optionally have it send audio all the time, or just when the
receiver squelch is open.

I need a way to generate a COR or signal present to the controller. I've
tried playing around with an OpAmp circuit driving a transistor to switch
+5V when a signal is present, but my understanding of them is obviously
not good enough as I can't get it to work.

I saw a posting on here regarding a motorola squelch chip. I wonder if
that would be a good solution as well.

Does anyone have any ideas how to take an audio line and generate a COR
from it? Either in the always-on mode, or on only when unsquelched?

Thanks to one and all for ideas! I'd prefer e-mail, I *will* post a summary.

Jayarajan:
Just a quick reply here. Obviously you'll want an antenna system that is
as efficient as you can get. If you can't use beams, ie yagi type
antennas, there are good wire antennas that will do the trick.
I made my first QRP contact in 1975 when my cousin, not then licensed,
asked me to try out his new Heathkit QRP rig. I hooked it up to an old
14AVQ that had maybe 6 radials,and enjoyed an excellent CW QSO. When I got

my Argonaut 509 all I could put up was a 66 foot length of wire and end feed it. I didn't think it would work but, again, filled up the log book with some pretty good contacts.
My point is a lot of hams I meet are hesitant to try QRP because they don't have "a good enough antenna". Granted the first time I hooked up my Argonaut to my friends 7 ele beam I worked New Zealand, even modest antennas, i.e dipoles, loops, etc. will "get out". Operating technique will make up for some system shortcomings.
Good luck.

6094. YAESU ADMS CAT Interface - ???

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-25 00:00:00 UTC
From: "Scott C. Gray" <comm5@pacbell.net>
Message-ID: <359323C0.DC8FC46C@pacbell.net>
Source record: 81830
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Just bought a Yaesu FT-8500 w/ FS-10 ("Mr. Potato Head") Microphone.
Nice rig - many features.
I'm not really pleased with the FS-10 as it takes a LONG time to program
in all the "bells and whistles".

I purchased the ADMS-1 software/cable package for my Yaesu FT-50R. A
rather nice way to go,
but YAESU seems to have made drastic changes in the good old "CAT"
hardware interface! These same
"changes" in the CAT interface appear in ALL the ADMS packages (both
mobiles and handhelds) - specifically a 1 wire bi-directional TTL I/O
versus the good ol IF-232 2 wire rx/tx data box.
There have been many hardware interface schematics published in almost
all of the Radio magazines
- many based on the MAX232 (and 233) IC's - even some using all discreet
devices. No big secret.
Fairly common design - often compatible w/ ICOM.

The '8500 manual briefly touches on a 1 wire (AND ONE WAY!) programming
example using ONE
of the the IF 232 lines to accomplish a "write" - no info about getting
data back- - -

I plunked down my 40 bux for the FT-50 RT Systems/ Yaesu package. I
really don't want to fork over
another $40 bux for the ADMS -2 package.... I DO have a couple of
MAX-232 (and 233) IC's and
bunches of PNP/NPN devices laying around - Homebrew is nothing new -
part of the "hobby".

Anybody know of any pages or links for the "New" CAT interface? Maybe
some Free ware / Shareware
programs to read/write/archive ???

The ADMS stuff isn't all that friendly... Frankly its not much less
clumsy as the darned "potato head"!!

Any constructive help is much appreciated!

Please remove the "cat" in my e-mail address for any private replies.

Scott KD6CQ

If you've read some of my other posts, you'll find that I
accidentally mistyped the subject of the text. I publically appologized
for my little boo-boo, and re-posted as "FS: pro-46.."
From the times on the origional postings, it was in the middle of
the night, and even though I double and triple checked the body, I
neglected to check the subject of my posting. Besides, I also own a '64
(which isn't for sale, and can not be modified) so this also contributed
to the slight confusion on my part.
I attribute my mistake mostly to my lack of caffeine at the time
of posting. :)

But it is a pro-46 for sale, and not a pro-64.

Remove the second, anti-spamming N from the
end of tdragon in my address to respond,

I am new to amateur radio,and am slowly building up a small collection of recievers tramsmitters etc,mostly out of sheer poverty I am building my own rigs,electronics has always been an interest but the sheer inability of sourcing the component to build even the simplest of device has always been a major bugbear for me,since involving myself in the amateur radio fraturnity I have had a great deal of help in sourcing many of the near impossible parts,but now I have really hit a brick wall,I am building a VHF down converter for my HF RX it uses two tubes a 6V8A and a 6DS4 navistor with a special miniture 5 pin chassis socket,I thought I had the parts in the bag but it turned out to be a dead end so I am hoping that somewhere someone might have these tubes/valves and would be willing to sell them ??????

Also I recently posted a querie about JW Miller.Co coils and several people put me onto Bell resources as they had taken over Miller some time ago and suggested I speak to someone in their JW Miller division but so far I have had no luck,I have emailed them,faxed them and eventually rang them (I did'nt like doing that as the US is an expensive call) but I have had no luck.

Would anyone have an old 1965 vintage JW Miller catalogue which they could use to look up some coils for me as this VHF downconverter only describes the coils as Miller part numbers,if I could find out what these coils are,it would be a simple matter to wind them.

Please could someone help me out

6099. 6m SSB Kits?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-26 00:00:00 UTC
From: martyt@pobox.com
Message-ID: <3593e312.184289684@news.supernews.net>
Source record: 81714

Anyone know of a 6 meter SSB transceiver kit?

I've seen TenTecs 20-to-6 meter transverter but would like to build a stand-alone 6m rig to play with. I have basically no homebrewing experience, but can assemble a kit with no problem.

I've also seen a couple of 6m designs on the web, but they consist mostly of hand-drawn schematics and no info suitable for someone with my level of experience.

Perhaps one of the older ARRL handbooks or some other publication has a relatively easy to construct design?

Any pointers would be appreciated.

Bud, maybe you should check the matching range for both units. I am not sure,
but I don't think the Kenwood units have a very big range. At least that is
what I understood to be true when I decided not to buy one for my TS-50S.

Even the new editions of the ARRL Handbook have designs for high power vacuum tube amps. In fact, transistor designs in the kW range are relatively rare. Tubes are still the most common way to go for high power.

Broadcast station "Pulls" can be worthwhile if you can get tech data on the tubes. Whatever you do, don't pay top dollar for used tubes. For new ones, the Russian tubes are the way to go. Svetlana has equivelants to most of the popular ones, they are of reasonable quality, reasonable price, and readily avaiable.

For your power level, a single band amp using a single 3-500Z will be a fairly simple project. Expect to pay over $100 for the tube, and a similar amount for the HV transformer. The filament transformer will not be cheap either. The '98 Handbook has an all-band legal limit amp using a pair of these tubes. Construction details are pretty complete, and the article can pretty much walk you through it, cookbook fashion.

Caveats: Make SURE your filament voltage is in spec, certainly within 5% for maximum tube life. and WATCH OUT when dealing with the 3000V or so plate voltage. Make sure you have bleed resistors around any capacitors in any high voltage circuit.

For a first time project, you might want to homebrew something in the 50 watt range using a 6146B or something like that, with no more than 300 or 400 volts at the plate. This will give you some practical experience with fire-bottles at minimal cost. The tube will set you back around $20, the HV power supply can be worked around by using a pair of high power 12V transformers hooked up secondary to secondary for isolation, and then a trippler or a couple of doubler circuits to get the necessary voltage. An old TV set might get you a suitable filament transformer. Such a project can make that old perfboard QRP

transmitter you don't mess with anymore a whole lot more interesting. Later you can always build one of the classic 5W tube transmitters to use for an exciter for an all hollow state transmitter. Then build your 500 or more watt tube amp. That gives you a real nice progression, I think. Now, for a receiver....

6103. RF-sensed PIN diode T/R switch at UHF

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-26 00:00:00 UTC
From: taylord@ecn.purdue.edu
Message-ID: <taylord-2606981413360001@instru1.ecn.purdue.edu>
Source record: 81718

I'm looking for construction details for a (fast) RF-sensed T/R switch which the brick style VHF/UHF preamp/amps probably use. This implies a PIN diode switch, rather than a relay, since I need a few microseconds or less switching time.

My use is with a data link at 33cm, and I need a starting point to see how these go together.

So, if you know where to find a schematic, description, etc., I'd appreciate a pointer to it.

Or, if you have the docs for your amp with drawings and parts info, and you could scan & email or post at a site....

Thanks in advance...

Hi Marty,

I know you want to go to a stand-alone rig, but I have one of the TenTec transverters, and I can tell you without hesitaiton that they are quality kits that do what TenTec says they will do if you build it by the book.

It was an easy kit, and the one question I did have about the winding of a coil was very patiently and clearly explained to me on the phone. It was money well spent. 73 de Steve, K4YZ

Gary, I've never really been able to get a handle on what makes a 1:1 balun provide better antenna radiation. I understand using a 4:1 etc, for impedance matching but whats happening with a 1:1?

Folks, before you put such an animal in the air;

1) Find out how close any flyers or clubs are from you.

2) Consider how much other flyers have invested in their aircraft
That you may shoot down. I have one engine alone that is $4K.

3) They went to a narrow band requirement - I believe 10Kc

Contact the AMA in Muncie Indiana. I'm sure they'll provide all the
info you need. I support the idea and think its great. Let's just do it
SAFE and SMART. 15 lbs of airplane at 80 to 100 mph can be a deadly
missile.

Bob Bethman
N0DGN/4
AMA 364117

P.S. Good luck! Let us know how it goes.

Dear D.Rea ... I am the Sr. Electrician for a "Major City" Fire Dept. I work on electrical systems of every thing the F.D. owns that moves ... fire trux, cars, ambulances, fire baot, airport "Thing" ect.

I can tell you from personal knowledge and experiance ... Don't put that much shit n a taurus... we have several taurus' in our fleet as hand-me-downs from the police dept. we use them strictly for office people cars cuz' that's all their good for, if that.

a typical lightbar with halogen spinners pulls a good 30A by itself, the police radios we use pull 20 amps when keyed, and about 10 on standby(we have 3 radios in each veh, one voice, one computer terminal, one vehicle locator system) this shit pulls.

you will not be able to make a taurus into an ambulance for first response use, it will not meet federal specs, I have a copy and it calls for a truck tierh type 1, 2 or 3 . we use type 1, a P.U. with a module on the chasis where the bed would be. type 2 and 3 are vans.

for the main power feeds to all that shit, or at leat to the main relay center you have to use a minimum of #6 wire, for a short run, to the trink, maybe a zero guage... or the wire will drop too much voltage.

typically the alternator is only 65 amps and cannot handle all that shit at idle and it will run your battery down.

We have 240 Amp alternators in our ambulances and we still have to put on a high idle device of somekind so the alternator can keep with the demand, if the medics don't put on the high idle device while at ascene or at the hospital, they run the batterIES down .... notice the emhasis on Dual batteries, high performance 800 CCA and 850 CCA batteries, Group 65s in fords and 78DTs in chevies... the chevy ambulances actually have 2 110Amp alternators connected in parralell... when 1 goes bad the extra loads soon kills the other one.

Take my advice, if all you have available for a veh. is that ford car, get just a red Kojack light and an electronic siren (if allowed by your states laws governing YOU), and use a portable radio that has a car charger unit. Don't go overboard with too many lights or other stuff or you will kill your batteries and your alternator, repeatedly.

> .....MAYBE as much as six amps, but sixty? Come on.

Ok Kids let's add up some "average"numbers, Ign system 10 to 15 amps, + headlights 15, all other running lights, as much as 10, in dash air blower (heat& A.C.) 15, AC clutch 10, stereo as much as 5, = close to 70 amps, and that's just the civilian shit. 35 Watt halogen lamps (typical for scene and flashers) - 2.5Amps Each, typical instrallation uses 8 (8*2.5=20) 20, motorola police type radio, 25 Amps when keyed, whelen 100 W. siren amplifier 10, 100W halogen spot lamp - 8, we won't add the module lamps, suction unit or any other electrical stuff unique to an ambulance module since this is a car, what do we have .... 63 additional amps (using just 1 radio - our medics have 3 not counting the ALS radio that's a 4th one) ... 63+70=133Amps ....the power adds up.

Keep in mind that Not even the big alternators on Real ambulances and fire trux keep up this kind of load at idle, a high idle device is a must to run this much shit. which brings us the the next point

> As I said before; the alternator is not this guy's problem.
> Wiring may be. A second battery will solve all his worries easily.
> It should be a cycle-service unit, not a car-starting one.

Our ambulance have dual high capacity batteries, the fords have 2 group 65s .. 850 CCA 150 reserve minutes, the chevy ambulances have 2 group 78DTs, 800CCA 180 reserve minutes....that average consumer car battery has about 100 to 130 reserve minutes. reserve minutes is the very important consideration for this type of use. our rescue squads and many fire trux have 31S-1000 batteries 1000 CCA - 240 Reserve minutes. I'm pushing to get 1000s in the medix....in an external module compartment.

Average cars have 90 amp alternators. Police cars have 110AMp alternators, the police lightbars pull around 25-30Amps depending on what kind they are, the siren allows for about 10, and the spots (2) allow for another 20 Amps. the police package adds about 60 Amps to the

cars normal load ...

Keep in mind that (at least in my city) the police have yards full of extra cars so if htey run the batteries down (or any other problem) in one car they just have it towed in and grap a different one.
The fire dept (in our town) dosn't have that many Extra vehicles at our disposal and have to make the stuff last.

hope this enlightens.

6113. Re: Questions on QRP Antenna, etc.

My point is a lot of hams I meet are hesitant to try QRP because they don't have "a good enough antenna". Granted the first time I hooked up my Argonaut to my friends 7 ele beam I worked New Zealand, even modest antennas, i.e dipoles, loops, etc. will "get out". Operating technique will make up for some system shortcomings.

Likewise, my first DX contact on six meters (SSB QRP) was N. Dakota from the S.F. Bay Area, and that was on a homebrew 2 element quad (my first NEC2 designed antenna). Patience paid off, as i was on the bottom of a pile-up. But i haven't had enough experience on '6 to say much or compare with other bands. Nor do i have no idea how good an antenna it is. But at least it's got a decent SWR and has already gotten me some nice contacts.

I can comment on satellite operation, though. I'm also currently operating QRP on AO-27, routinely talking to Canada, Texas, and beyond. I just began this a couple weeks ago, so i haven't tried any sked's yet. It is certainly a challenge (and i won't bother trying on weekends), but it's also lots of fun and beats the heck out of not opeating, waiting for the "right equip-ment", or spending alot of time on setup.

? special gadget ? how about 2 diodes in the special gadget.
spcial diodes to handle the current and voltage.

Motorola had an ap. note or article reprint on a micro (68hc11) controlled
RC transmitter.

You can pull a lot of information from datasheets for the now obselete
ICs from National or Philips. Look for a 10-15 year old databook (or
in the obselete section of National's web site) for the likes of the
(National) LM1871, LM1872 or (Signetics/Philps) NE5044, NE5045, NE544.

Like most consumer electronics, the chips have gone east. I hear that
Samsung makes RC encoder/decoder chips equivalent to the ones mentioned
above, but their parts seem to be unobtainium in hobby quantity.

> be able to handle this?!? I have a gold tap right off the batt terminal,

In general the cars ignition system draws about 60 Amps - usually
supplied direct from the Alternator rather than the battery (except when
starting).
Headlights (on high beam (120W each)) draw 20 Amps plus another 10 Amps
for other lights, etc.

Based on this - as long as the engine is running and the headlights are
off - shouldn'e be a problem - particularly if the engine is really
running (riving revs) rather than idling.

Cheers

Bob: I guess you intend to install the equipment in the Ford (vs
another car or different equipment), and modify the 12 V electrical
system if needed. I would suggest either installing everything, or
temporarily connecting it, running the motor at idle and city traffic

speeds, and measuring amount and direction of current to the battery.

I checked some Hanes Automotive Repair Manuals, a consumer how to repair your car soft cover book available at auto parts stores. They say an inductive type ammeter is available at most auto parts stores. This type meter will measure current from the magnetic field surrounding a wire, so the wire does not need to be cut and an ammeter put in series.

You need to put the ammeter on a wire between the battery (or battery and starter), and everything else. You then can turn on the equipment, run the motor, and see if the battery is supplying current, or the alternator is providing adequate power and charging the battery. Turn on the headlights, and note the direction the ammeter needle is moving (motor off). This is the discharge direction. I think the battery could discharge when transmitting, but should charge under other conditions.

Finding the proper wire in a modern car is difficult, but Hanes has wiring diagrams. Remember to have adequate protection in case your wiring shorts to ground. This problem happened to me after dark years ago. The lights went out, and the wire became red hot, an awkward situation.

While ago when I was browsing around in the Grase Lake Hamfest(IL), I saw one
guy selling a lot of junk stuff. In short, I found some tubes on the table,
and they looked EL156s. Well, they were 6 of Telefunken EL156.
I couldn't believe my eyes because they were there on the table as if they
were one of junk stuff.
I asked the price to the guy, but then he asked me how much I would pay
for them.
I took a deep breath, and said "15 bucks?". I knew it was kinda out of question
amount for the EL156s. But I didn't have an ohm meter to check if the filaments
are ok, etc...
He said "these tubes are not common stuff that you can find everywhere".
Finally I payed $20 for all 6 EL156s. God!, when I went back home and checked
them, their fillament were all OK!
I consider this the giga-deal in my electric life.

I have some bitter experiences.
When I was a high school kid, one day I was walking in Akihabara, the world
biggest electric town in Japan, I saw one guy selling a lot of GT tube sockets.
Well, at least they looked GT sockets to me. The price was very cheap.
I thought that should be a lifetime buy so that I don't need to worry about
at leat GT socket for rest of my tube life.
The stuff I bought was *NOT* GT sockets, but they were relay sockets.
If you plug your GT tubes into the sockets you can no longer remove it easily.
The metal contacts of the socket 'bite' the tube legs tightly.
If you are familier with some of relay sockets, you know what I'm talkig about.
I bought literally a hundred of them. This was one of my pico-deal.

Now, what is your giga-deal and pico-deal?

I love the flagpole vertical, I've tried to talk a friend of mine who is concerned about the regulations in his trailer park to try this. Any dipole or inverted Vee will work fine, along with the vertical.

> this too long for 3W CW ? Should I restructure my shack to shorten the
> cable length ?

I doubt you'll see much REAL difference between 213 and plain vanilla RG-8, in an emergency once I replaced mine with 100ft of 58U from Radio Shack and could tell no difference from a practical operating point of view although I'm sure you could have measured greater loss I really think it's negligible.

> 3. Do I need a 1:1 balun if i use a inverted V antenna with the above
> mentioned cables ? Can I just use a connector and hook up the cable
> directly ? I am asking this from the point of view of loss.

Never used one, although there is a mismatch between 52ohm coax and a 72 ohm dipole, again, the loss is very small.

> 4. Is there a lot of activity in the 80 m band in CW QRP ? Is it worth
> considering designing a shortened 80 m antenna ?

Yes lots of QRP on 80 and 40, although I suspect they'll be temporarily abandoned with increased MUF to 15 and 10m.

> 5. How do wave (antenna) traps work with 3W CW for multiband antennas
> (like inverted V) ? Has anyone used a wave trap for QRP successfully ?
> Where can I get details to build wave traps (I have never built wave
> traps so detailed instructions will help) ?

I looked into that but had several talk me out of it in favor of a multi-element dipole, basically just make dipoles for 40/20/10 the 40 will resonate on 15 with a little help, I spaced my elements out using small dia. PVC. I don't know how easy it is to adjust a dipole with traps but the multi-element dipole was a snap, tuned each element with no interaction between bands, Im not sure if it's the same for a trap dipole.

>
>
> 6. I have a radio shack portable communications RX. Has anyone used this

> freq. QRP TX and use the radio shack RX ? Has anyone tried this setup ?

You can absolutely do that, just remember you'll need an antenna switch if your going to use the dipole into the RS RX. I still have an old RS 150B, that and an old 1 tube homebrew on 40 works just fine.

You might want to visit my site and download an antenna
program that I wrote. It is nothing real fancy but has some
not so standard wire and vertical antennas in it. One is for
a shortened antenna .. 75 meters at about 105 feet vs the
normal 120 or so.

Ham Radio circuits galore

Hi all,

My brand new 233MHz Pentium computer blew up, so I have to take a rest from adding to the homepage for a while. Now I have the chance to tell you all about it. There must be about 80 different projects on the page now, from antennas, transmitters, receivers, test equipment - you name it.

My recently bought me a digital camera for my birthday so I have now photographed some of the projects as well as the PCB foils and circuit diagrams that were already there. I will be using the camera extensively in all future projects, when I can get my hands on a computer that works.

If you are interested in circuits and constructional ideas then please take a peek at

http://user.tninet.se/~acz732k
http://hem2.passagen.se
http://come.to/sm0vpo

I am unable to answer my E-Mail until I get another motherboard that does not send smoke signals.

Best regards Harry

So do some BNC elbows.

Crappy connectors are widely available in just about all styles.

On the subject of PL259/SO239 ratings, the values published are usually impractical as their breakdown voltage seems to be measured without a cable, so no allowance is made for what their usual method of braid attachment does to the dielectric end, along with the risk of rogue strands and blobs of solder getting into the clearance zone. Just 'cos a connector is rated to some voltage is no guide to what voltage it can actually be used at. PL259's have been made with better cable attachments (but try finding them).

Cheers
David GM4ZNX

I think "F" is my least-favourite connector, but it's a close thing....

Steve: A number of us are currently building the Mighty Midget RX
from the April 1966 QST. Some of us ae using old chassis from
Heathkit Benton Harbor lunchboxes. I have mine almost done and it
works very well on 40 and 80, CW, SSB and AM.. Also good for SWL
work on 40. Getting 455 kc crystals for the filter is kind of
tough, but mine works well with a 455 kc IF can in place of the filter
(if you don't mind a broader bandwith) . Check it out! Good luck.

You might look at Omron.They have some PCB mount relays that are spec'd
at 68dB isolation at 900Mhz.I'veused them at 1.3Ghz.Available from
Digi-Key. 73 Ken W6GHV

>VE1VVV
>

Mag mounts rely on a very large capacitance between the base and the
metal car for the ground connection. It's sufficient for VHF/UHF.

I made a 5/8 vertical for 2 meters using a coil inside the mag mount base
with a tap on it connected to the coax. Both the coax shield and the
bottom of the coil were attached to the foil on the bottom of the mag
mount base.

Mike Souhrada wrote:

> GL on that project! I truly believe it is not economically feasible.

It's not "economically feasible" to homebrew a 10m SSB rig, either.
It would make a lot more sense just to go out and buy one. But
a lot of us would rather build our own.

Building a 1/2 watt 50 Mhz FM transmitter and a matching receiver
is a trivial project, using chips designed for cordless phones. I just
need to know how to modulate the signal with the control information
and demodulate it to work the servos. It seems like using a PIC
at each end would be overkill. So how do I translate joystick
movements into servo movements?

Personally, I think that "no one else is doing it" is a GREAT reason
for me to try it. Heck, I'm going to keep careful notes and take
pictures along the way. Maybe a magazine article will come out
of it.

Just in case anyone is interested, I'm not actually planning to use
this for flying an airplane. I want to use it to provide axis/elevation
control to a kite-borne platform carrying a video camera with a
915 MHz ATV transmitter on it. I'll also use a servo to activate
the shutter on a 35mm camera for Kite Aerial Photography.
The video will let me see where the camera is pointing, and the
still camera will give me higher resolution images than I can get
with the video.

And since a 4-channel radio control system will still have one
channel left over, maybe I'll use another servo to control the
zoom lens on the video camera.

Fun, huh?

Winter? We don't have that here. In sunny south Louisiana, flying, fishing, and camping are all year-round activities. If anything, you avoid outdoor activities in July and August to avoid the intense heat and humidity, and the attacks of killer insects.

Unfortunately you will have to do this. I had to pay $20 plus $35 shipping (I live in Spain, long way from Kansas) for ADMS-1D so that I could program my VX-1 too, as I had the ADMS-1C for my two FT-50s, but didn't have the version for the VX-1

>Anybody know of any pages or links for the "New" CAT interface? Maybe
>some Free ware / Shareware
>programs to read/write/archive ???

Not for Yaesu radios, this protocol remains 'secret' and exclusive to RT Systems. The manual tells you of the commands to send to the radio, but you need a TTL to RS232 level shifter, such as Yaesu's own or (maybe, I have not confirmed this yet) and OptoLinx.

>The ADMS stuff isn't all that friendly... Frankly its not much less
>clumsy as the darned "potato head"!!

I know - I wish I could find out how the serial protocol works and write my own program...

Best regards,

Mike

If you can get someone to copy the ace silver seven manual for you, it's a good introduction to rc control. The servo's today use the same 1.5 ms center 1 to 2 ms pulse about 50 cps or so. The silver seven used a signetics chip to mod and demod the 7 channels, one chip answer that is (I guess) out of production, at least it's not on their web page any more.

Yes, a pic would be the answer, the old ace micropro 8000 used 256 resolution (8bit)I think and did just fine. The newer computer radios use 1024 (12 bit) and several 12 bit 8 channel A/D's are out there for the pic stuff, if you're looking to start this project off really one step at a time, you could buy the flight pack and build the tx, then move to the rx and servo later. The rx's on the market are cheap and lite, same with the servos, most of the cool stuff goes on during the encoding side of the show anyway (IMHO)

Let us know how you do

I'm relatively new to homebrewing and am interested in building a tube type amplifier to run on AM/CW/SSB. I have a 1960 Handbook which has construction articles for several from 500 to 1KW. I'd be more interested in the 500W range.
Being new to this, and can't afford to spend a fortune on new parts (if they are still available). Can anyone give me some pointers on building these vintage amps and how I could go about scrounging up parts? I would really appreciate any help/suggestions. Thanks.
Terry (KA5IHV)

>long wire antenna along the gutters on my house. A flagpole vertical is
>also a possiblity. So my question, what would be a good ant for QRP from
>the types above and any related designs?

The inverted Vee will be better than the other two. A wire beam or a regular
tubing yagi will be better still, of course. The former can be cheap, the latter
can be aimed. Both work. Verticals are always a problem, more so for
QRP because of ground losses. Avoid them if you can, elevate them if
you can't.

>2. I would like to put as low loss a transmission wire as possible (cost
>permiting). The local ham store sells RG213 for .36 per foot and LMR400
>for .59 per foot. Is the LMR400 worth it over RG213 as far as QRP work
>is concerned ? Also I am estimating a cable length of about 50feet. Is
>this too long for 3W CW ? Should I restructure my shack to shorten the
>cable length ?

At HF, feeder losses are generally low enough to be ignored. The real
issue is power handling, and with QRP that isn't an issue either. Plain
RG8 will be fine, even RG58 will be Ok if the SWR is low. But if you
want a really low loss line, at virtually any SWR, then use ladder line.
It's pretty cheap in window line form, and you can build your own in
open line form. For QRP, even TV twinlead will work.

>3. Do I need a 1:1 balun if i use a inverted V antenna with the above
>mentioned cables ? Can I just use a connector and hook up the cable
>directly ? I am asking this from the point of view of loss.

A proper 1:1 choke balun will introduce virtually no loss, and will make
all of your signal radiate from the antenna rather than from the feeder.
Since the antenna will almost always be a better antenna than the feeder
is, this is a no brainer, use the balun.

>4. Is there a lot of activity in the 80 m band in CW QRP ? Is it worth
>considering designing a shortened 80 m antenna ?

80m QRP is *tough*. Lots of QRN, and efficient antennas need to be
large and mounted *high*. I'd suggest you stay nearer the MUF when
operating QRP. Your skywave signal will be stronger, and noise will
be lower.

>5. How do wave (antenna) traps work with 3W CW for multiband antennas
>(like inverted V) ? Has anyone used a wave trap for QRP successfully ?
>Where can I get details to build wave traps (I have never built wave
>traps so detailed instructions will help) ?

I wouldn't use a trap dipole. They're finicky things to tune up. Go with a fan
dipole or use ladder line and a tuner with an ordinary doublet flattop.

>6. I have a radio shack portable communications RX. Has anyone used this
>radio for QRP RX. Can I just build a simple crystal controlled fixed
>freq. QRP TX and use the radio shack RX ? Has anyone tried this setup ?

Yeah. You can do it, but you'll very quickly wish for a better receiver.
The RS SW receivers are plenty sensitive, but they lack good selectivity
and overload immunity. On a crowded band, they'll tax your operating
skill to the limit. On a nice quiet band like 30m, they may do just fine.
(30m is an excellent QRP band. Atmospheric noise is pretty low, QRM
usually isn't very bad, and everyone is restricted in output power so you
aren't such a little gun.) The RS receiver will probably tax you pretty
severely on 40m, and during contests on 20m.

Ken: I too have been thinking about Q multipliers for use in simple
HB receivers. I spotted a very neat, simple circuit in the 1963
Handbook. One IF transformer, one variable cap, One PNP transistor a
few assorted caps and resistors. Runs off a small battery. 455 kc
IF. Meant to run (literally) alongside the RX, with no need to run
power wiring to it. One shielded line to the IF chain is all it
takes. Let me know if you need more info.

If anyone out there has a good way of explaining how the Q multipliers
work, I'd appreciate hearing it. I'm not sure my understanding is
correct.

Two ideas:
1. There was an interesting design for a regen. receiver in QST June 1998,
pp35-38. There is also a regen receiver in the 1998 ARRL handbook (pp17.68-72)
. You could use the detector stages from either of these.

2. There is a Q-multiplier design at Harry's Homebrew page
<http://user.tninet.se/~acz732k/use/qmult.htm>. This uses one transistorand
just a few passive components.

>assigned a departmental vehicle in which to respond (i.e., a vehicle
>designed for such service)?

In the Northeast, and in most rural areas of the country that rely on volunteers, many of them must use their own vehicles to either respond to pick up a garaged emergency vehicle or to go to the scene as supplimental personnel. Because many fire and ambulance disrticts have a low tax base some departments must make do with $40,000 a year for fuel, maintenance, radio repairs, training costs, etc. What's your budget? In my area, my local F.P.D. covers 110 square miles and the closest fire station is 5 miles away. If you are closer to the call than to the station, that's where you go. BY LAW here in Missouri, volunteers are allowed to use blue lights and a siren. In NJ, we were allowed to use a blue light under certain conditions. As the Chief of the department, I was authorized by the state to have and use RED lights and a siren. My town was lucky it had working equipment. I would've been booted out on my ass if I asked the politicians for a special vehicle for myself rather than keeping the fleet of response vehicles maintained.

My closest PAID, tax and fee-for-service subsidized Paramedic unit here is 38 minutes away. The ambulance district uses volunteer first responders in the community to bring CPR and automated defibrillation closer to the scene. They don't pretend. They're as real as you are.

>It's no wonder folks in the profession ask why full-time regular-salary
>emergency workers look down on the part-timers cruising town in their
>pretend emergency vehicles.

The guy who originated the message wants to build a "buff car," and I laugh at that (mostly 'cause I had one myself- NOT at HIM because he volunteers) but that's no reason to slam him or volunteers as less than full-time employees or pin them with pejoratives.

In the '80s I was a Full-time, professional Paramedic (AFSCME Local 2507) in New York City and in Jersey City (AFSCME Local 2465 we were not a bunch of TV glamour boys on either job, I guarantee you!) and still volunteered my time and expertise in my home community - and I used my own car there. Several of my partners were vollies in Long Island and NJ. They used their own cars, too. None of us ever

pretended or looked down on anyone else in emergency services.

Eighteen years and 900 miles after I carried my first stairchair down five flights in a project I still volunteer when I have the time - and I still use my own car.

That's how it's done elsewhere. I'm sorry if it makes California or Hawaii look bad.

Steve

So is this some sort of a hi power transistor, MOSfet or some kind?
I'll take a look at the wab page.

Which I have a question on. How much current should these diodes
be rated for? I look at alternators, about 65 Amps to 80 Amps.
So is 100 Amp rated diode more than sufficient?

Most(?) radios use the NE5044 for encode and NE 5046 for decode...however, i could not find it on the Phillips page. Note that these are encode/decode ONLY...you'll still have to build the transmitter and reciever around them.

6153. 624 Kits - Need Manuals: RX-1 & TX-1

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-27 00:00:00 UTC
From: aci6@aol.com
Message-ID: <1998062701021800.VAA04855@ladder03.news.aol.com>
Source record: 81732

Hello Everyone,

I am looking for complete documentation on these 624 Kits: receiver (RX-1) and QRP transmitter (TX-1).

I need the assembly instructions, parts lists, board layouts, schematics, etc - that were supplied with the kits.

When I purchased the receiver and transmitter last week, I was unable to get the manuals. I do have a complete TX-2 QRP transmitter assembly, etc manual that is available for trade, etc..

I checked with Pat Bunn (former owner of 624) and he is unable to supply this information. I do have a copy of the article in QST by Gary Breed but would like to have a copy of the 624 Kits documentation as they differ some what from the QST article.

Please reply via email.

Thanks for reading,

Bill

"Brad Johnson" <bradj@tir.com> writes:

>If you put another battery in a car, should it be wired in series or
>parallel?

Neither. It should be isolated via a special gadget available from
an RV dealer. That will allow the second battery to charge from the
alternator without allwoing circulating currents between the
batteries.

>Ok Kids let's add up some "average"numbers, Ign system 10 to 15
>amps, ...

I objected to sixty amps for the *IGNITION* system. Yes, loads add
up. No, the ignition system is not the only load.

I'm also not arguing with your statements on full-blown circus-wagon
loads. But the original poster spoke of loads far far less than you
mention.

For your case, I have just what you want. It's a WWII surplus "P1
aircraft generator" - 300 amps @ 28 volts, gear driven, oil cooled.

Failing that, I also have a deal on 200 amp 14 v Leece Nevill [sp?
it's been years; we used to call them Leaky Navals..] alternator;
hope you have a big enough engine belt for the pulley on it...

From: Peter Bolch <nc-bolchpe@netcologne.de>
Message-ID: <6n2ca5$ku6@news.netcologne.de>
Source record: 81738

Hi,

I've been asked by some people here to share my information about low IM distortion voltage tuneable RF filters with massive parallel varicaps.

All I found was an article by U. Rohde in QST 12/94 ("Key Components of Modern Receiver Design: A Second Look"). Rohde describes a filter used in the Rohde & Schwarz ESH-2 receiver in which up to 5 varicap pairs (MVAM125) are connected in parallel. Frequency range is 10 - 30 MHz. Input and output impedance is 50 Ohms, the filter impedance is 12.5 Ohms. Intercept point of this receiver with the filter in line is 30 dBm.

I don't quite understand why using varicaps in parellel will decrease IM distortion und such things. I always thought the distortion occurs because strong RF signals cause a variation of the capacitance of the tuning diodes. But this should happen if several diodes are connected in parallel, as well.

Could the reduction of the parasitic resistance be the reason for the better IM performance? And if so, why? Any ideas?

Peter

Actually, an isolator is only required if you intend to use the batteries separately, but want them both to be charged by the alternator when the car is running. Like power aux equip from one without discharging the other so you can still start the car. This is how RV trailer batteries are often done.
If you are adding the extra battery just to make additional current available then no isolator is needed. All Diesel powered light trucks, of which I've owned a few, come with 2 batteries to handle the load of the starter, and they are just in parallel.

Steve: I came across the old QST article on the Miser's dream RX.
The first thing that struck me about it is its double conversion (or
was it triple?) design. I know that double and triple conversion was
all the rage back in the mid 60's, but looking at some of the current
literature (especially in the QRP world), it seems to me that single
conversion superhets are now the favored design. They sure are a lot
simpler!

I noticed that the Miser RX uses some 2.2 kc filters that came in
little grey rectangular cans. I have number of filters on this
frequency in similar cans. Different manufacturer but they look very
similar. Not sure of the bandwith but I'l bet its about 2.4 kc. If
you decide to build the Miser and need the filters, let me know.

And if done the way Roger Smith did it, it's a loser. The real
problem with parallel batteries is balancing the load. To do that
you need to equalize the lead resistance. Even so, you get
circulating currents. The better approach is a correctly-sized
starting battery to begin with....

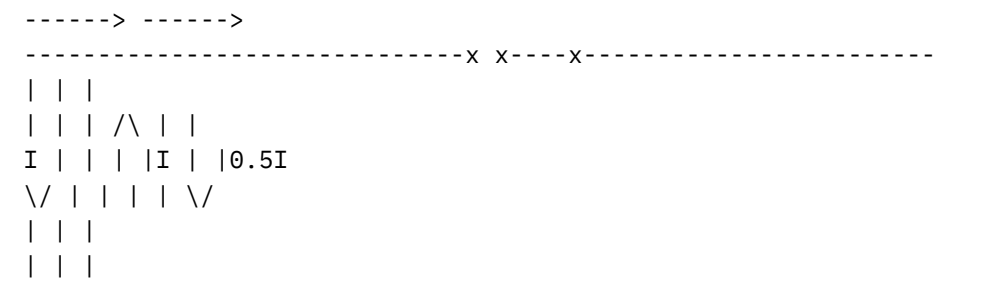
[Use a fixed pitch font to view the ASCII art.]

Ok, here's a dipole:

```
I I
------> ------>
------------------------------x x----------------------------
```



At resonance it needs equal currents flowing in each leg to work properly.
The currents have to flow in on one side of the feedpoint while they flow out
on the other to generate the standing current wave on the antenna. So the
feeder must supply currents differentially to the antenna in a balanced
fashion.

```
I I
------> ------>
------------------------------x x----------------------------
| |
| | | /\
I | | | | I
\/ | | |
| |
| |
```

If proper balance is maintained, the currents on the feedline are
exactly equal and exactly 180 degrees out of phase with each other.

So there is no radiation from the line. Antenna currents are exactly
equal and exactly in phase, so they reinforce to produce the antenna
radiation pattern. All is right with the world.

But what happens when we connect coax directly to the antenna feedpoint?

Coax is balanced line in that the currents on the inner conductor
and the *inside* of the outer conductor are differential and equal.
But coax has defacto a *third wire*. This is the *outside* of the
coax. It is separated from the inside of the coax by skin effect,
and it is *directly connected* to one leg of the dipole. Currents
will divide between that dipole leg and the outside of the coax.

The vector sum of the in phase currents on the dipole will now
be less, so the broadside radiation from the dipole will be less
(and skewed in direction too). The currents on the feeder will
now be greater, and not in balance, so the feeder radiates too.

Now I showed the currents dividing equally between one leg of
the dipole and the outside of the coax. This won't normally be
the case. The currents can divide in any ratio depending on the
common mode impedance of the dipole leg and the common mode
impedance of the outside of the coax. This depends on a number
of things, including length, objects in the near field, and what
may be connected to the far end. It would be an extremely unusual
happenstance if both the dipole leg and the coax had exactly
equal common mode impedances. So the current may be greater on
the feeder or on the dipole leg, we can't say without more
information about the particular installation. In any case,
this is bad, and we want to avoid it.

The way to avoid it is to use a choke balun. This can be nothing
more than coiling the coax up right before it attaches to the
antenna. This coil has inductance, and the reactance of that
inductance will raise the common mode impedance of the outside
of the coax shield. With that path now having a higher impedance,
less antenna current will flow on it, and more will flow on the
dipole leg. With enough reactance, virtually no current will flow
on the coax outside and virtually all will flow on the dipole leg.
This is exactly what we want.

What about the currents on the *inside* of the coax? Since they are exactly equal and exactly 180 degrees out of phase, they produce no net magnetic field and the inductance is invisible to them. As far as they are concerned, it isn't there.

Now simply coiling the coax can often produce enough inductive reactance to the common mode current. But in some cases we need more. To get more, we can use a toroid and wind the coax around it. The inductance is multiplied by the relative permeability of the toroid material, and we get more inductance. Coax is often bulky to wind on a toroid, so we can wind a wire pair instead, and connect the pair ends to the coax and the antenna respectively. The effect is the same, and at HF the different characteristic impedance of the pair won't matter for the relatively short length used.

We can also slip ferrite beads over the coax instead of winding it into a coil. These act as a loss resistance to the unbalanced current's magnetic field. If we make this loss resistance large enough, not much current will flow through it. So we achieve the same result as with the other designs. (Again the differential currents *inside* are balanced and have no net magnetic field, so they don't "see" this resistance.)

So the purpose of the choke balun is to make the currents go where they are supposed to go, onto the dipole legs, and not go where they aren't supposed to go, down the outside of the coax shield. That's all there is to it.

I am looking at building at 10m SSB/CW rig. I have looked in app. 15 of the ARRL handbooks from 1970 onwards and there is nothing there, just lots on 80m, 40m and even up to 12m and then hop to 6m.

Is 10m kit building a problem ? And does anyone have some good links to possible sources of such info. ?

You probably are not aware of this new "gadget" for battery isolation. It has
special switching in a solid state package without the diode voltage drop.
With one model you can crank an engine through it with your backup battery.
You can read about it here: http://www.hellroaring.com/products.htm

Exactly the same as the Eimac 8560A. They are marked with the Motorola part number. I have seen a pair of those at 1500 VDC on the plates stay keyed down in repeater use for 6 hrs at 350 watts out. Darn god tube. The bigger the heat sink the better. If you can find any arround, try and find the pa deck that Motorola made for the MPY series base stations. The heat sinks there are big and veryt good.

I'm fairly certain I've seen radio modeller magazines in the racks Stateside,
but haven't paid much attention as I'm more concerned with sitting in aeroplanes
I take charge of, but I glance at anything with an aeroplane on it. The ones
over this way used to have designs of transmitters and receivers, so I'd guess
the same would be available over there.

I'm _thinking_ of trying to design and build a little QRP CW transceiver for myself, probably 30M. Probably as an exercise in futility and frustration.<g>

I remember back in the 60s Heath had a neat Q-Multiplier. It peaked up and isolated CW signals nicely and had a nice deep movable notch to get rid of interference. If I remember correctly, it was a regenerative circuit of some kind. I was thinking something like this might be simpler than a crystal filter in a simple receiver. Perhaps something could be put together with op-amps? In a _very_ quick search I see a few op-amp circuits for variable bandpass filters in _Art of Electronics_ but they do not appear to be what I want. Most are pretty complicated with fairly high parts counts. Can anyone steer me to information on such a circuit (if such exists) from a source I can still get - old magazines and old ARRL Handbooks are hard to find. I don't need an exact circuit, just the design principles and perhaps any formulas needed to calculate circuit values.

Maybe I should just review super-regenerative circuits in the Handbook?

Source record: 81753

They've never really been a popular item, so it's likely that nothing
has been published. I've never seen anything. There was an article
in 73 about twnety years ago that talked about the potential.

Probably the big source of information is AMSAT, since of course
any non-digital repeater that has been put in an amateur satellite
is a linear translator. Perhaps they can supply some information. You
can get some ideas from articles about the actual satellites that have
appeared in the ham magazines (I don't have any particular dates). While
the circuits were not published, detailed block diagrams were.

I think there were (are?) some linear translators put into operation in
California at one point. Some guy who's name was Eagleson (did I get
that right?) seemed to be the one mentioned as knowing quite a bit about
the topic.

The point being that you are not likely to find articles in the handbook
or the magazines, but will have to ask around, or at least look into the
small circulation esoteric journals.

A linear translator is fairly simple in itself, though I don't know if
the implementation brings out complication. You have what amounts to
a superheterodyne receiver with the detector and audio amplifier removed,
and a wider IF filter. Then you mix that up to your output frequency,
and amplify it. I think you'd have to add agc, and that perhaps is an
area of fidgeting, since you are dealing with a wide bandwidth. I'm
thinking of an OSCAR, where the passband might be 100KHz wide; maybe
a terrestrial based translator would only deal with one signal at a time?
If it's expected to handle more than one signal, you have to deal with the
fact that they won't all be the same power level, and a higher power
signal can hog the output power (it being a linear translator, the
strongest signal in is the strongest out).

There may be a good reason why linear translators have not seen much
use. Or it just may be that nobody is interested in trying them out.
The lack of information may reflect the lack of interest, or it may
create the lack of interest.

If you find any sources, be sure to report back.

Yup. Right now it is hooked up to a MFJ-901B but I am also messing around with some homebrew "L" networks. I am working on an easily duplicable design for a simple tuner for my web page. Mostly I am weighing pros and cons of various types of homebrew capacitors. Anyway, I never bought an automatic tuner. If I ever do, it will probably be one of the SGC units when I can justify the expense. They'll match up a wet kitty and are fairly well weatherproofed.

You know, I was thinking about a similar idea to use in the "receiver of my dreams" that I am working on. I thought a regenerative receiver with only about a 2 kHz tuning range centered at an IF freq would make a really neat detector stage in a superhet. Also thought about a Q-multiplier scheme, possibly around a ceramic resonator, would make a good IF filter especially for CW where a nice flat-top passband is not needed. The thing with regens is they are usually pretty touchy when it comes to tuning and the regen setting. I figure making the tuning bandwidth as narrow as an IF passband would improve stability immensely and possibly make this practical. This would replace the conventional BFO setup and also the AM detector. Also, the Q multiplier is an old idea that might ought to be taken down off the shelf and re-examined, especially for an IF stage of a simple CW receiver as this would reduce dependence on crystals. Hard to do a decent job of putting together a really good filter without quite a bit of test gear, and getting a used one cheaply is pretty iffy.

If you run across any promising circuits, let me know. And let us know how you're doing if you build anything that works.

So, what exactly do you want to stash in the trunk?

You have received some very decent advice- but it's all speculation (including mine following). You can probably get by with a dash light, if the law and your car insurance authorizes you for it- an electronic siren, a lower power radio, like a Maxtrac and maybe alternating flashers when you lift up your trunk so you don't get waffled on the roadside. If you want to charge a radio, cellphone, flashlight, portable suction unit or an AED, I'd suggest taking them inside, plugging 'em in and carrying it out with you for the call, otherwise trickle charging only when the car is running and the buff gear is off.

For my "free advice" (worth what it costs, you know)- Forget about bar lights, "Aerosticks," a heater for the drug box, etc. or you're liable to not start your car when somebody needs you (been there, done that, went to a few calls on a bicycle a few years ago. I don't think I could do that balancing an AED and a portable suction unit on the handlebars; I don't think I could do it for fires, though... wearing boots, turnout coat & helmet... on the old ten-speed, all I'd have to do is make siren noises and flail my arms at drivers as they passed me - oh boy! <smirk>).

But seriously, an emergency response vehicle, like the ones that are custom built by departments' shops or commercially built by outfitters like Odyssey have major reworking, especially in the electrical system! I wouldn't expect to have a large radio deck like some paramedic units have, a full lightbar or anything like that in a Tortise. In the city I just worked for, Tortises are assigned to inspectors, administrators, etc. who go from place to place on a schedule, not respond to fires or medical calls. They are cheaper and

they don't have all of the other equipment. If you really want a car set up for a big electrical load, you probably could pick up an old police car at an auction. They're made a lot differently than your car.

My own vehicle, an old full-size blazer, has blown an alternator or voltage regulator every two years or so since I've had it because I HAD all sorts of junk (Syntor-X for Low Band, Icom for Hi Band, Syntor-X 9000 for UHF, Spectras for 500, 800 and 900 MHz, sealed beam lightbar, flashing headlights, flashing tail lamps, siren, strobe pack for grille/ intersection lights, etc.), along with my love for climate control, a stereo and the electric rear window. Yes, I put in a slightly bigger alternator and a bigger battery, but that's not quite enough. For what I had in there, I needed much more and still blew the regulator on a fairly regular basis and opened a winding in the alternator once in a while.

I had to take the thing apart to do a rust-rot refurb on it (duct tape & spray paint only got me so far) and only put back what I needed, scaling the truck down considerably (The wife thought it looked ridiculous and I needed more space for my 3 kids... can you believe- it looks almost *normal* not like "240 Robert" anymore !). I haven't had any trouble since (truck & wife).

You can build almost anything by throwing time and money at it. At what point do you exceed practicality?

Whatever you do, fuse ALL OF IT near the battery so if something shorts out it won't "catch up," just blow the fuse.

Good luck, whatever you do, how ever you do it, it's still your car. Don't get into trouble having "unauthorized" equipment or destroying an otherwise good car.

6178. Help to make an antenna of 36 MHZ

Hello,

I wish to produce an antenna of the fialaire type granted on a
frequency of 36 MHz. Knowing that the quarter of wave is about
2 meters, it is a dimension of antenna still too significant for
my realization. I would like to thus decrease this length by
adding a coil to him to compensate for this reduction.

But I cannot how make?

Somebody could it indicate to me :

1. How to calculate this coil according to the new length?

2. How to carry out it and test in experiments the
agreement of this type of antenna?

Thank you in advance for your answers.

Today a PIC is probably just the way to do it. There used to be a
number of special purpose proportional control ICs on the market,
but these all seem to have become obsolete. So unless you can
get a custom chip from a late model RC setup, the best thing to
do is use a PIC. Cheap and small. In fact, I think there's a Basic
Stamp application for driving an RC servo that's in that list of
Basic Stamp programs that appears here from time to time.

The way RC servos work is via pulse position modulation.
Each channel has a time slot in a data frame. There is a
pulse transmitted in this time slot. When it is in the center
of the slot, the servo assumes a neutral position. Advancing
or retarding the pulse position in the time slot causes the
servo to advance or retard its position from the neutral
position. Slot timing and pulse width are speced for
commercial RC servos, so if you want to use them, you
have to conform to their timing. If you do your own
servos too, you can use whatever timing is convenient.

The pulse frames can be transmitted FSK, with mark
representing a pulse and space representing no pulse.
Or you could encode with modem tones and transmit
FM. Unless you want to be compatible with commercial
RC radio gear, you don't have to follow their exact
transmission methods.

The most obvious effect of using this filter at 12.5 Ohms
is reduced peak-peak RF voltage across the varicaps, thus
reducing the IM distortion due to decrease capacitance change.
In this case the voltage would be half that of a 50 Ohm system.

I must ask why your department and your city/county allow a privately owned vehicle to be dressed up as an emergency vehicle? If you have passed your state's emergency vehicle driving course, then why aren't you assigned a departmental vehicle in which to respond (i.e., a vehicle designed for such service)?

It's no wonder folks in the profession ask why full-time regular-salary emergency workers look down on the part-timers cruising town in their pretend emergency vehicles.

The inverted Vee will be better than the other two. A wire beam or a regular tubing yagi will be better still, of course. The former can be cheap, the latter can be aimed. Both work. Verticals are always a problem, more so for QRP because of ground losses. Avoid them if you can, elevate them if you can't.
-- Gary Coffman <ke4zv@bellsouth.net>

What about six meter QRP for a older van? (n.b. Most actual QSO would not happen while in motion.) Would a DDRR be a distinct improvement over a simple vertical? Are there other antennas which are also either low profile or can be removed without alot of difficulty for hard-to-avoid low clearance areas like airport parking garages? Roof penetrations are fine (there's even an uncommitted chassis-mount BNC there already) and it'll be repainted soon anyway.

Don't be a ding-dong, Jeff. Perhaps you've never encountered *volunteer*
emergency services, but such things exist, even in California.

I won't disagree that "wannabes" are obnoxious, but you can't overlook
the fact that not all counties are as well-off as the one you live in.
There's a good chance that this "first-responder" is trying to help.

Maybe you could ask about that before feeling compelled to post a flame?

And even more lives might be saved if he were driving a vehicle designed for such service. There are some pretty stringent standards that a manufacturer must meet for their product to be placed into emergency service. Taking a Ford Taurus and placing lights, siren, and radios in it strikes me as an odd approach to assembling an ambulance vehicle.

Has he passed his state's emergency vehicle driving school (usually sponsored by the state highway patrol)? Will he be running stop signs and red traffic signals at intersections? Is he setting his city/county i.e., taxpayers) up for a massive lawsuit if he has a TC enroute to a call?

Our paid-call firemen were sternly instructed to report to the station in a code-two fashion (obeying all traffic laws); anyone using their vehicle in an improper manner was immediately dropped from the department.

Steve
Your approach to generating a COR has a couple of problems;

The squelch (mute) on VHF/UHF receivers works by detecting and rectifying supersonic (i.e. higher than about 5Khz) noise and using that to generate a voltage which closes a gate when no signal is present. This noise is usually only present right at the FM detector and is fitered out (it's called de emphasis) before it is sent to the radios audio circuits. Thus your connection at the microphone socket will be de amphasised and not contain the noise needed for a noise squelch to work.

There are some very good audio mute circuits around (especially in australia where HF SSB is used by all and sundry in the outback) which work by detecting two or three specific frequencies in the audio range (i.e. 300hz to 3Khz) and opening a gate if two or more of them are present.
They have disadvantages for VHF/UHF repeater use however.

By nature they are slow to open. This can be overcome by using an audio delay line to delay the audio long enough for the mute gate to open.

The also require a built in delay to prevent the mute gate from closing between syllables and this delay means they will have a relatively long 'noise tail'.

A far simpler approach for you would be to find a COR output from your radio.
I am not familiar with the TM-742 but most rigs these days make provision for RFDCD for packet TNCs and provide this output to a socket.

If not you will have to delve into your radio and find the mute gate and bring the required voltage out.

Incidently most 'Amateur' type rigs are NOT a good choice for a repeater receiver.
I wouldn't contemplate using one on a mountain top site as their large signal handling and intermod performance is VERY poor.

6189. More Mighty Midget RX News

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-28 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <35969d7e.22626024@news.erols.com>
Source record: 81680

Solder melters:

I guess you know you are becoming a fanatical homebrewer when even Field Day can't pull you away from the workbench!

Here's the latest on my Mighty Midget RX project. This receiver is really FB! I've been amazed by the stability. After a very brief warm up period, I can leave it tuned to rag-chew roundtables on 75 or 40 for hours without having to re tune. It's got all the sensitivity needed on these bands: I can hear the band noise!

Without the crystal filter, selectivity is, of course, not so great but the two 455 kc IF cans do an adequate job for phone. Last week I bought a couple of 455 kc filters (one Toyo, one Collins) on the net. I also found some 455 kc crystals. During the next week or so I will be doing some cut-and-try experimentation with various filter arrangements and will report results to the group. I'm also thinking (a little) about an outboard Q multiplier. BTW, this morning I came across an article in the February 1963 issue of CQ describing the pioneering crystal filter work of J.J. Lamb. Lamb wrote QST articles in the August 1932 and March 1933 QSTs describing how to achieve single signal results with one crystal and a variable cap.

Frequency coverage is great! With a little pruning of the oscillator coils (wound on pill bottles!) I now have coverage from 3558-3992 kc and 7030-7593 kc. The tuned circuits in the RF amp and mixer grid circuits don't really allow for a "peak" at the low end of 80. I could fix this by adding a bit of capacitance, but I'm not really planning on using this RX for CW so I won't bother.

I have had some trouble getting the two ganged tuned circuits to track properly. The two section variable cap I'm using is missing the little screws for the trimmers, so I just experimented a bit with external trimmers of similar values. I found I could get good tracking on one band, but not both. I suspect the inductances of the hand-wound coils are not close enough for good tracking. I decided to optimize for 40. 75/80 still sounds great.

I notice some "mixer pulling" of the H.F. oscillator when I swing the cap in the RF amp and mixer grids. But this is no big deal.

On really strong SSB sigs, it seems like I don't have enough BFO energy to properly demodulate. I suppose I could put coupling cap between the BFO and the IF amp, but instead I just back off the RF gain a bit and everything comes out just fine.

I thought about putting another stage of AF amplification in there, but the Sixer chassis is getting a bit crowded and I decided not to push my luck - too much AF gain on too small a chassis might cause the kind of feedback trouble that I've completely avoided on this project. The RX works fine with headphones, and for speaker operations I just plug in one of those computer speakers with an internal AF amp. Works great!

Parts that I've noticed are hard to come by: 455 kc IF cans (AES is out of them!) and of course 455 kc crystals.

One final note: When involved in a project like this, its a lot of fun to browse through the radio magazines of the era. Its amazing how many tips and ideas you can pick up by doing this.

I hope the other MM projects are going well.

Bill,

Someone kindly suggested

http://user.tninet.se/~acz732k/use/qmult.htm'

to me via email. This has a circuit that sounds a bit like the one you described, together with other info. It is a little different - no variable cap - but uses a pot instead.

Recieves on:
29- 54mhz FM
66- 88mhz FM (after keypad trick)
108-137mhz AM
137-174mhz FM
406-512mhz FM
806-956mhz FM (unblocked)

Has 100 memories in 10 banks. Runs off of 4 AA batteries.
Included are the AC adaptor / charger, and instruction manual.
The restoration trick involves soldering SMT components,
I've allready done that for you. Plus, you can undo the hardware
mod and then do the keypad mod. "Oops, sorry about resetting it
like that officer, but as you can see, this can't do cell..." :)

It works just fine and has no problems.

Asking $140, or best offer. Remember, the price is open
to negotiation.

I'm selling because I'm currently between jobs and don't
use this at all anymore. I need the money more than I need the
hobby.

Remove the second, anti-spamming N from the
end of tdragon in my address to respond,

Recieves on:
29- 54mhz FM
108-137mhz AM
137-174mhz FM
406-512mhz FM

Has 50 memories in three banks. "Private" bank holds 20
user selectable freqs, "Police" bank holds 20 user selectable
freqs and has a bunch of pre-set freqs that can be locked out,
"Fire/Emg" bank holds 10 user selectable freqs and has has a
bunch of pre-set freqs that can be locked out, "WX" bank does
all weather freqs, and "Air" scans the entire aero band.
Unit uses a mounting bracket, which was lost by the
previous owner. Not included. No manual, but I can instruct on
how to program it. Runs off of 12v DC, power supply not included.
Basically, just the unit itself. But it'd be a great
little thing to keep out in the car or truck.

It works just fine and has no problems.

Asking $70, or best offer. Remember, the price is open
to negotiation.

I'm selling because I'm currently between jobs and don't
use this at all anymore. I picked it up to put it in my car, but
never got around to doing it. I need the money more than I need
the hobby.

The *engine* can handily supply whatever you need in terms of *horsepower*.
Rather, the alternator and the motion transfer system (i.e. belts and
pulleys!) will be the issue (even replacing a small alternator with
a *huge* alternator won't guarantee that the belts, etc. will be able
to drive it fully loaded)

>> I will probably need to pull 10-20 amps on standby, which I know is no

Well, I'm not sure as to the "need" for the "gold tap" :> but the
10AWG wire (stranded?) is a win. When you're pulling a nice heavy
load you don't want to be wasting power in a silly wire!

Bottom line is to use the least amount of power you can. Folks who
do a lot of *boating* have learned to carefully note the power
consumption on their radios, etc. Power isn't free.

Um, isn't it a bit pretentious for you to *assume* that all municipalities
provide this equipment for the use of these people? My home town had
an all volunteer fire department -- which provided ambulance service
as well. Aside from the actual "fire trucks", the town owned *no*
other vehicles. "Volunteers" contributed their time (!) as well as
their own transportation, etc.

No, you couldn't just put a light on the roof of your car and call yourself
a "volunteer" -- certification *was* required. And, for anyone *else*
in town to use such an "emergency" light was as illegal as dressing up
in a police officer's uniform would have been.

>>It's no wonder folks in the profession ask why full-time regular-salary
>>emergency workers look down on the part-timers cruising town in their
>>pretend emergency vehicles.
>>
>>Jeff KH2PZ (former Southern California fireman)

Ah, yes... "California".. where money grows on trees -- but municipalities
like to default on their bond issues! :>

A hearty thanks to those folks who really do *serve*... in spite of the
fact that *they* have to pay to outfit their own vehicles, etc.

6m is in a way a special case. If you are working local SSB, a horizontally
polarized antenna like a halo can make sense. If you are working local
FM repeaters, a vertical is a must. If you are working skywave Dx, it just
doesn't matter because the polarization of the skywave will be altered
by Faraday rotation in the ionosphere anyway. For Dx, you are mostly
concerned with gain and takeoff angles. Directional antennas are
preferred for fixed use, but omni-directional antennas are necessary
for mobile in motion use.

I don't think the DDRR is the right answer for any of these situations.
It is simply a low profile, low efficiency, vertical radiator. (Yeah, vertical,
the ring is just a top hat for the very short vertical radiator.)

If you are going to operate mostly portable rather than in motion, I'd
seriously consider a folding 3 element yagi on a short tilt up mast for
Dx and distant SSB line of sight operation (can fit on a set of tradesman's
ladder racks on the roof when not in use). Add a vertical for times
when you operate in motion or are working FM. Looks geeky? You
bet! But it will be effective.

>doesn't have to be high power.
>
>

First of all, Ian, the power you will probably need for such wide coverage is illegal. Secondly, what you want to do may also violate one of the most fundamental rules of the noble art of radio: Thou Shalt Not Cause Interference. As to the first, it is unlikely you will be prosecuted unless you violate the second. As to the second, there are ways to minimize the potential for interference.

To begin with, proper output filtering is essential. If you do not know what that is, STOP RIGHT NOW! First things first! Learn more about electronics before proceeding. Get a ham ticket. Upgrade. You will be giving yourself a basic Fundamentals of Rado Electronics education, one easily digestible bite at a time. See my web site for more details on getting a license, and follow the link to the ARRL site. If you already know how to construct a 7 or more element low-pass filter for the desired frequency, then continue reading.

FM Broadcast frequencies are at odd multiples of 100 kHz. Digitally tuned radios will receive your signal poorly if you are not on a standard frequency. That is the first thing to remember in selecting a frequency. Next, do some SERIOUS listening. You want a nice receiver and a high gain antenna up in the clear. Select a channel on which not only do you not hear any other station, but also not hear anything on the channel above or below it. The reasons are simple... Even though a commercial broadcast station must use at least 100 watts of power and typically runs kilowatts, in a marginal coverage area of the station, someone near your station might want to listen to the distant station. Even if you are only running 1/10 of a watt, you could cause severe interference. Likewise on adjacent channels. You are likely to have splatter onto adjacent frequencies especially if your transmitter is overmodulated.

Also, I advise you to keep the content quite clean. Transmit controversial material at your own risk, and avoid profanity. You will be noticed and could find yourself in trouble if there are enough complaints to the right person.

Now... there are many sources of designs for FM broadcast band transmitters, from extremely simple to professional quality systems. The "Mr Microphone" toy is an extreme example of the former. There are wireless mic kits available from

Rat Shack fur under ten bucks. These are very low power, and generally will be legal to operate under Part 15 rules. Your range will depend on your antenna. a 3 foot piece of wire should give you a range of a couple hundred feet to a receiver with a simple whip antenna.

Slightly more sophisticated kits and a couple of very nice ones are available from Ramsey. http://www.ramseyelectronics.com I believe is their url. Some other urls of interest are
http://www.freeradio.org/ the Free Radio Berkely site,
http://boojie.rt.csuohio.edu/ant/wcsbpt1.html
http://www.lib.ox.ac.uk/internet/news/faq/archive/radio.broadcasting.low-power-faq.html (whew! that's a long one!)
http://www.wp.com/jbgizmo/page7.html

I guess I better post part 15 to my web page. look for it in a few days. These are the rules you are expected to comply with to remain legal. If you insist on running illegal power levels, there are other stations doing so and getting away with it. This is a real gray area, though, so expect to either be run off the air or pay big legal fees, unless ACLU or somebody takes your case pro bono. If there are no complaints, though, it is unlikely you will be harassed. Note that even with clean output, both signal and content, you will rouse the ire of commercial stations who paid millions of dollars for equipment and licensing, and have DAILY payrolls that exceed your highest possible total equipment expenditure. They may take it upon themselves to shut you down. Free Radio Berkely has been fighting successfully to stay on the air for years, as have several other micropower broadcasters. But it is a continual struggle, and the Feds are not giving up easily.

My advice? forget about a transmitter with the range you want. You will be operating illegally. Write to your congressman and tell him how unfair it is for the megabuck stations controlled by multimegabuck corporations to have a stranglehold on broadcast radio. Tell him how unfair it is that the FCC will issue a license for a high power station, but will not license any station under 100 watts, but still insist that this service which they refuse to regulate is persecuted and prosecuted by the very agency that refuses to regulate it. Micropower broadcasting has a place in the radio spectrum and could answer a need for a fresh, free-format source of news, arts/music, and information.

Below is a recent post on the subject of low power FM broadcasting, and legalization of the same. Don't break the law... CHANGE IT!

>>
Subject: How to FIGHT for Low Power FM Radio
From: Rodger Skinner <radiotv@cris.com>
Date: 18 Jun 1998 03:24:12 EDT

OK, folks...it's time to do some serious lobbying of the two top movers and shakers if you want to see LPFM created. Here's what must be done. In addition to your own Congressman and both US Senators, we need to educate these fellows on the merits of LPFM and why it should be allowed to be created by the FCC. These folks oversee the actions of the FCC and we need their support! When

calling ask to speak to the legislative assistant (L.A.) who advises the Senator/Congressman on telecom issues. If you can't get through to the enator/Congressman directly, this is the person you must persuade of our goal of LPFM creation. Email, call, write letters and follow up with faxes. Always be polite and courteous even if you disagree strongly with their positions when speaking or writing these folks.

SENATOR JOHN McCAIN (R-AZ):
Chairman of the Senate Committee on Commerce, Science and transportation As Chairman of this powerful Committee he has direct oversight of all FCC matters. It has been said that he will not support anything that the NAB opposes. We need to educate him on why Low Power FM needs to be created and what benefits it can bring to America. You need to write, fax, email and call his office and tell them you support creation of a Low Power FM service.

Here is a website with McCain's addresses and phone numbers:
http://www.capweb.net/classic/State/AZ/Member.morph?memberCode=S105AZS1

Senator John McCain
Washington Contact Information
241 Senate Russell Office Building
Washington, DC 20510-0303
Phone: (202) 224-2235
Fax: (202) 228-2862
Email: senator_mccain@mccain.senate.gov

Here is McCain's website where you can read his speeches and get a feel for what he is about.
http://www.senate.gov/~mccain/

In the US House of Representatives-

CONGRESSMAN W.J. BILLY TAUZIN (R-LA):
Congressman Tauzin serves as Chairman of the influential House Telecommunications Subcommittee in Congress, which has oversight of all FCC matters as well. His support is also necessary for LPFM to be created. You need to write, fax, email and call his office and tell them you support creation of a Low Power FM service.

Here is Tauzin's website with his contact information and some background info.
http://www.house.gov/tauzin/
Please address your concerns to Billy at one of the addresses below.

You can E-mail by clicking http://www.house.gov/writerep/
W.J. Billy Tauzin
Washington DC Office
2183 Rayburn House Office Building
Washington, DC 20515
Phone: (202)-225-4031

Here is a good website with more info on Billy Tauzin. Check it out
before contacting his office.
http://www.capweb.net/classic/State/LA/Member.morph?memberCode=H105LA03

Representative W. J. (Billy) Tauzin
Washington Contact Information
2183 Rayburn House Office Building
Washington, DC 20515-1803
Phone: (202) 225-4031
Fax: (202) 225-0563
Email: http://www.house.gov
URL: http://www.house.gov/tauzin/

If you don't take the time to contact these people then you cannot
consider yourself a serious supporter of the LPFM movement. No excuses! Just do
it and get as many others to do it as you can. That's what you can do to help
create a LPFM service for yourself and others. Tell them that you want to see a
LPFM service created as outlined in RM-9242 or with whatever changes you'd like
to see. If you don't do this, you have let down the LPFM movement and yourself.
If we can muster enough support, we can have LPFM...it's that simple!

Let's tell them what we want them to do before the July 24th deadline
for reply-comments at the FCC. Chairman Kennard cannot do this
alone...he needs your help!

Fightin' the fight for LPFM,

Rodger Skinner

>PCB overlays would also be a great help but not essential

In the old days, you'd use a shift register to step through a diode
matrix or EPROM, and encode the call as 1s and 0s in the LSB
of each address. They'd trigger an audio oscillator and a PTT line
to hold the repeater up during the ID (set MSB to 1 for that). You
need a couple of timers in addition. Today, just program a PIC.
It can handle timing, code generation, tone generation, and PTT
management all by its little lonesome. Quick, easy, cheap. If you
aren't up to speed with PIC assembler yet, I think there's a
Basic Stamp application which is already written to do this.
Check the list that floats by here from time to time.

I don't know about anyone else, but they sound at least
vauguely interesting, esp if one were put up in place with relitively
crowded bands. My own thought were a passband just narrowing than
FM, and acting like a bunch of repeaters at once, for SSB. If

something like that were around then maybe the cities would less
crowded on the air

Along with all the high tech solutions:

Just wire the second battery trough a car headlamp. The lamp
resistance will allow charging of the second battery with minimal
voltage drop (PTC characteristics of the lamp), but when starting the
engine, the second battery will only attribute the current the lamp
will allow to flow or less (< 5 Amps).
This works a lot better than diodes as a forward diode voltage drop
will not allow the second battery to be fully charged.

I suppose it depends on whether you know why you want to build the
receiver and what you are going to get.

I built one about a year ago and was thoroughly disappointed. But my
intention was to be able to listen to amateur radio SSB and CW - it's
worthless for SSB, and not much better for CW. Also very difficult to
tune, and the VFO is not at all stable - even after running for an
hour, it would still drift a lot.

Works fine for AM shortwave broadcast stations, though. So if you're
interested in shortwave, it may do fine for you.

The kit was easy to build, so if you're looking for experience in that
area, it serves the purpose well.

The best explanation I've seen is that the Q-multipier's active device acts as a negative resistance (!) and cancels most of the "bad" positive resistance that degrades the Q --- and bandwidth --- of a tuned LC circuit. If the LC is parallel, you get a sharp bandpass filter. If it's series, you get a sharp notch filter.

Of course if the total resistance goes negative, you have a nice oscillator!

Message-ID: <VA.000001ca.0104b6d3@together.net>
Source record: 81623

RE: 813 Filament voltage

Thoriated Tungsten filament tubes like these
need 'enough voltage and current to produce the
electrons for the peak plate current you run'.

New tubes often need less than the 'nominal'
filament voltage for adequate output. Higher
voltage than this just wastes filament like.

BUT if your filament voltage REGULATION is not
good you need a higher voltage to assure
'enough' even when the voltage drops.

I was able to more than double the service life
of 833's and 4-400A's and 4CX5000's in broadcast
service by carefully controlling the filament
voltage. I used Sola type constant-voltage
regulators driving a Powerstat type autotransformer
or a (large!) rheostat. About once a month I
dropped the filament voltage on RF tubes until
the output started to drop, then took it just up to
the point where there were 'excess electrons'. For
AM transmitters I monitored the audio distortion
on a test tone, and set both RF and AF tubes to
where distortion stopped decreasing.

All this is to say: it's best to be able to ADJUST
the filament voltage about +- 10 percent from
nominal.

> > I'm trying to build a homebrew TV antenna for UHF and VHF and any help
> > would be appriciated.

I built a 6 wavelength rhombic for channel 23 by using half inch pvc pipe
and 18 AWG wire. The theory was sound but it was 18 feet long and did
not hold its shape very well.

I reduced it to a 4 wavelength at 12 feet long and it has been in the
air for a couple of years with no problems.
The characteristic impedance of the terminated rhombic is 700 ohms so
I built two on the same frame at 1/2 wavelength apart and put a twist
in the cable that connects them to compensate for the phase reversal.
It out performs the all-band 120 mile yagi that we were using.
I used the formulas for length and angles from the Radio Amateurs
Handbook.

Good luck with your project. I hope you decide on something other than
a rhombic and post the results. I have yet to see a homebrew post
that wasn't a rhombic or yagi but I couldn't find a better type.

6220. battery system??

From: baack@maine.edu
Message-ID: <6n8jd7hjo1@sol.caps.maine.edu>
Source record: 81625

Howdy all,

I run deep cycle batteries for all of my VHF equipment in the shack,
which I have to charge about once every 10 days.

Now, I was thinking that I could get another one of the same battery,
then I could connect the two in parallel (or series??) to keep the voltage
the same but increase the amp reserve, and reduce how often I need to
charge the batteries.

Am I thinking straight on this or do I need more sleep after being up all
weekend for Field Day?

pro's con's ??

How would you charge that system as well?
Leads coming off of each battery with the charger in the middle?

Thanks,
Jay n1rwy

There are several examples in the _ARRL Antenna Book_ and _ARRL Handbook_. Check the index under "transmatch", another name for an antenna tuner. There are also some designs suitable for receiving and low-power transmitting in Hayward & DeMaw's _Solid State Design for the Radio Amateur_, available from the ARRL.

Source record: 81628

Hi Bob -

I just built the 40M version and have yet to put it on the air. But with a 12V gelcell battery I get 4W output from about 7.01 to 7.08 MHz. The VFO is rock-solid; full break-in, and good keying waveforms. A signal of .02 microvolt is audible(!) though in the real world external noise would bury it. Single signal reception. I'm pleased!

Jim Horn WB9SYN/6 (Studying to upgrade to Advanced so I can use it)

6224. Wanted: Eimac 4-400 data sheet

Source record: 81630

Gentlemen,

If I learned one thing in my years in the service, it is to praise in public, punish in private.

Several items come to mind when I see a post such as this:

(1) Of what intent is the author by doing so? According to the QRZ Database, N8DJP (and I subsequently assume the repeater under his call) is in Dearborn, MI. Of what use is the allegation that KC8BXD is "abusing" an autopatch to me in Chattanooga? There can be no other intent but to humiliate BXD, and regardless of the nature of his autopatch useage, shame on the authors of this letter for doing so.

(2) Is the N8DJP repeater's autopatch open or closed?...If it is open, then it is incumbent upon the trustee of the repeater to perform such control operator functions as is necessary to terminate BXD's patches. But if it is a closed machine (dues must be paid in order to have access to the patch), BXD is exercising his right to use the patch as long as those patches are not interfering with other traffic that is in progress and is not otherwise contrary to Part 97. Whether you care to hear him on the air or not is irrelevant.

(3) Does BXD's patches interfere with other QSO's in progress? If not, he has as much right to use the repeater as any other licensee. If there is a QSO in progress, and the operators voluntarily relinquish the frequency, he once again is not at fault, and has the right to carry on such communications as are allowed by Part 97. If his patches DO interfere with or are otherwise disruptive to communications in progress, then I refer back to paragraph 2, and it is incumbent upon the trustee of the repeater to enable such control operator functions as are necessary to terminate the patch and announce on the machine why it was terminated. Do not shirk your responsibility to exercise control of the repeater by humiliating another Amateur in so broad and public a forum.

And my last comment deals with that forum in particular. This particular newsgroup is entitled "homebrew". Of what purpose is there in posting this item in THIS forum? Is the posting of this "warning" not an abuse in and of itself?! Our 11 meter friends often refer to us as "Hambos" and otherwise derisive terms for postings just such as these. Is this any way for the Amateur service to conduct itself?

May I suggest that you do as I just did, and look up his FCC database address on line and send him a registered letter voicing your complaints? Then if he insisits on violating whatever protocol you have established for your repeater, you will have sufficient evidence to terminate his activities

thereon?

Otherwise, he is just another Amateur with no more or no less right to access of the airwaves than any of the four of you. Please refer to Part 97's admonishment that no particular frequency is assigned exclusively to any amateur, save those reserved by class of license.

yeah, I suppose 10 autopatches in ONE day isn't abuse. he's been
warned, verbally as well as in writing, and I'm for one sick of his
ways, and the only way you even get autopatch ability is if you pass
you're exam for races membership, well, KC8BXD, Ol' Henry over there,
thinks it's his free ticket to abuse the repeater, Autopatches are for
emergencys or for if you can't get to a real phone, I wonder is Henry
gonna come up with the money to make up the difference in the cost of
the phone when he runs N8DJP's phone bill up sky high? No.

In my book, KC8BXD is a LID, a 2 meter jockey, and wanna be ham, and a
few other choice words.

Sir,

KC8BXD IS a ham, the FCC database says so.

Your opinion as to wether or not he is a lid is just that, an opinion, but
a libelous one since you have chosen to broadcast your thoughts in this forum.
I hope he sue's you, improper autopatch use or not. You deserve it.

I reiterate MY opinion that your group is shirking it's responsibility to
operate the repeater accordingly. If you don't want him on that patch, shut
the repeater down while he's mid-sentenence and that will send him packing.
Otherwise, No one outside of Dearborn Michigan gives a rat's kazoo about
your problems. You obviously don't have the intestinal fortitude to deal with
this problem yourself, please don't expect someone else to come to your aid.

If you don't want this fellow on "your" repeater, shut it off, PL it, or
put a control operator on it as necessary, but be a man about it and DO IT
YOURSELF!

I'm trying to help my father get his marine vhf radio operational, (kinda scary being on the water with no communication), and with my experience getting my Tech+ license figured that I'd have much better luck getting some help from the Ham crowd. :)

It's a "Standard" radio. It receives fine but won't transmit in low or high power mode (1/25 Watt I beleive). There is a large semiconductor mounted in the back of the unit, right on the heatsink. It's made by toshiba and the chip number is S-AV6. The only reference to this I can find on the internet is someone saying they've had to replace several. Does anyone have any ideas as for what I can do in testing this?
Possible pinout of the S-AV6, or another track i can take on trouble shooting?

Thanks for any help.
Keithl,
KE4QOL

6239. Need Mic. Pinout for Icom IC-V100

I am looking for the Mic. pinout for a Icom IC-V100.
I picked one up with a programmer but no Mic.
Thanks in advance.

Of course, the charging current will also be limited to something considerably less than the current rating of the headlamp, because at rated current it drops 12 V. But in other respects it's a clever and cheap solution. Dig that crazy high-intensity charge indicator!

Maybe this will help you:

"Subject: FS: 12 Volt Gel Cell Batteries From: tje@usol.com (Tim English) Date: 1998/06/19 Message-ID: <3595ab6b.7420018@news.usol.com> Newsgroups: rec.radio.amateur,rec.radio.amateur.boatanchors,rec.radio.amateur.digital,rec .ra
dio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.r adi o.amateur.swap,rec.radio.cb,rec.radio.swap [More Headers][Subscribe to rec.radio.amateur.boatanchors] Have about 40 used 6 and 7AH 12 VDC gel cells for sale. Also have about 10 4AH 12 VDC cells. All load tested good. PERFECT for QRP rigs and portable operation. I have sold hundreds of these to the QRP boy's on the QRP mailing list and all have been very satisfied. Had a few damaged in shipping and one came back DOA which I replaced for the fellow free of charge but that's it. I am the service manager for an alarm company and we change our customers batteries every 3 years as preventive maintenance. These used cells should provide another 2 to 3 and probably longer service if used and recharged properly. Cells come fully charged and are ready to go. They can be recharged with a simple wall wart charger available at Radio Shack or a 1 amp automotive charger. I guarantee against DOA. Brands are Yuasa, Interstate, Radionics and Portalac.

4 ah cells are $8 shipped CONUS
6ah cells are $10 shipped CONUS
7ah cells are $12 shipped CONUS

If you buy 2 of the same I will knock $3.00 off the total price.
Images of the cells can be seen at:

But be aware Mr. Dunifer (Free R. Berkeley) is at least temporarily off the air, after having lost a round in court last week. They ruled he should have applied for a 10-watt license (even though the FCC regulations specifically state such a license won't be granted); then, after the FCC denied the application, he would have had "standing" to argue his First Amendment rights were being unnecessarily limited.

Still, it seems to me the FCC is going to have to make some kind of provisions for legal broadcasting at power levels between those possible under Part 15 (about 0.1 watt) and those possible under Part 73. (100 watts) Or, they're going to have to come up with some way to prove that this "gap" in legality is necessary. Judging from the public statements of the Chair, I suspect they're going to take the first route & find some way to legalize microbroadcasting. It works in most other Western countries (including Canada), it sure should work here!

The last few amps that I built I used an MFK model 16010 ant tuner, it`s a two knob tuner but works very well.. bring the two shafts through the front panel put the knobs on or you can cut a hole in the front panel to fit the tuner about 2x3 inches ..trying to find a ready made all band tuner is a problem and trying to tye it into the band switch mechanism is a problem too. Good luck

Good post, Doug. I was unaware that FRB was off the air. I just checked in with
them a few days ago. I have long been thinking about starting a 50 to 99.999
watt <g> station in my hometown. I live in the top floor (3rd) of the highest
building in my little town, in a central location, and have plenty of space,
and for free advertising I could easily get another vacant, un-liveable room
elsewhere in the building if necessary for studio or transmitter or both space.
I would really like to see a local free-format FM station oriented towards just
our town and visitors here. Anyway, it has been on my mind, and I was only
recently in contact with Mr Dunifer and so I was surprised that he has been
shut down. I was under the impression that he had in fact applied for a
license... that is the logical thing to do if you are going to try to establish
legality of operation. Too bad. Well, I am anxiously awaiting public
announement on any rule changes in this area. Thanks for the up to date info.

wrote:

: area of fidgeting, since you are dealing with a wide bandwidth. I'm
: thinking of an OSCAR, where the passband might be 100KHz wide; maybe
: a terrestrial based translator would only deal with one signal at a time?

For high orbit satellites, the path loss remains nearly constant and
predictable for hours (and up to a minute for low orbit satellites),
so manually adjusting the ground transmitter power manually will work.
Since the OSCARS transmit on a different frequency band, the ground
station can monitor the returning own signal and adjust the
transmitter power accordingly.

: If it's expected to handle more than one signal, you have to deal with the
: fact that they won't all be the same power level, and a higher power
: signal can hog the output power (it being a linear translator, the
: strongest signal in is the strongest out).

Trying to hit a ground based translator from a mobile station will
cause very large signal variations due to multipath (on an FM system,
much of the rapid signal strength variations is absorbed by the
limiter action in the FM receiver). If multiple mobile stations use a
single ground stations simultaneously, the relative signal powers
would fluctuate enormously, running the agc system crazy.

With non-crossband repeaters, the user stations would need to have
repeater style duplexer cans. Even if your own transmissions could be
monitored on the "downlink" by some automatic power control system,
the path loss would be different for "uplink" and "downlink" due to
different multipath signal fades due to different wavelengths for
uplink and downlink. A signal null on only the downlink is not a
reason to increase your transmitter power, but how do you know if the
fade is on the uplink or downlink.

6249. Re: Where O Where to find PCB relay/switch for 2GHz ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-29 00:00:00 UTC
From: spam@nospam.com
Message-ID: <359745ca.4076892@news.lin.foa.se>
Source record: 81708

Teledyne Crystalonics used to produce small metal-can relays that had
good specs, but they don't come cheap. And I do not know if it is
possible to buy these in small quantities.

NAISSDS RG1 SPDT or RG2 DPDT used to produce small pcb-relays intended
for VCR equipment, 75 ohms (usable at 50).
0.4 dB loss at 900 MHz
65 dB att at 900 MHz
These were speced up to 1 GHz but I am sure they work up to 2 Gigs
with lower specs, price is right 10 dollar.

Or you can use Toyo Tsusho CX-120A (Henry Radio)
Power-typ coax relay with pcb-mounting but rather poor attenuation at
higher frequencies...
Cheers

>
>Are there any plans out there to build an ATU or is the cost the same
>as buying one? I saw I think it is LDG has a 100 watt kit for $219, I
>can by one for $229 for my TS-450 so their is not such a deal.
>
>

The $219 is the fully built and tested version, i.e. not a kit. The kit is
about $180 from LDG, and I note that it seems capable of dealing
with a wider range of antenna reactances and loads than the normal
antenna tuners offered by manufacturers. The LDG version is probably
not quite the equal of the SGC 230, but then again that costs a lot
more than either of the two mentioned above.

I finally note that an antenna tuner is a compromise, but if you can
put up resonant antennas that present reasonable loads on the
frequencies you normally use, you don't need one, and if you have
a lousy antenna, the tuner isn't going to make that antenna work
better, it will just allow your rig to feed more power into whatever
load you have, assuming of course that most of the rf isn't converted
into heat by the tuner.

> Fran KM1Z

These are standard techniques for pipe-bending... as was filling the thing with molten lead and allowing to cool before bending with brute force, then heating to recover the lead. On a lateral tack, if pipe of some diameter is available, then someone, somewhere ought to have a bending machine with matching mandrels.

There's nothing that says you have to use pipe. Copper lightning conductor strip could be a lot easier to work with, or a composite could be made of a number of small bore pipes forming a strip, 10mm "Microbore" heating pipe could be an easy route. The thing aim to avoid joints around the loop. With the radiation loss acting as a small fraction of an Ohm resistance, it is easy to create many times this resistance from soldered joints in an octagonal loop made with plumbing fittings. Connection to capacitors is the other weak point where efficiency can be decimated.

Cheers
David

6253. Re: Linear Translator need 2 M plans to build one

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-06-29 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <35975c17.0@newshost.pcug.org.au>
Source record: 81712

It would seem that the AGC system is a big problem with linear translators. But what about a linear translator with a bandwidth of 3 kHz? This would only be able to repeat one SSB signal at a time (but maybe several CW sigs) and would need only a simple audio AGC to ensure consistency of audio output.

Such a device is effectively an SSB repeater. However it's range would be more than FM repeaters. The unit as described above could be built simply by hooking up two SSB transceivers together. The use of a device like this could allow full-duplex operation provided that the translator transmitted and received in different bands (eg 2m and 70cm).

The use of an SSB squelch circuit (as described in 73 magazine about 18 years ago) would reduce power consumption of the translator, but may make it less sensitive to weak signals.

As far as I know, there are no linear translators in Australia, but there may be one in New Zealand. Definitely an area worth more work.

Or you could use one of those $15 digital message recorders, and record the Morse onto these with a keyed oscillator.

I used one of these as an auto CQ caller on SSB. It worked extremely well.

Hey! I'm a 2-meter jockey as well as respectful of proper amateur practice and one hell of a great fella. Did I mention humble, too? I pay my ARRL dues, support several local clubs, participate in ARES and RACES, and buy radio equipment to help keep the dealers and manufacturers in business so they can afford to be around for you.

What is a LID anyway? I've heard it used a lot. Mostly on these rec.radio newsgroups where all the 'real' hams hang out. You know, like you, Chuck.

So why don't you plan to run a milliwatt more power and apply for a Class A
license? Then you'd be legal, and I can't imagine that the extra milliwatt on
your power bill would break you.

Small town broadcasting is a mom and pop business. It isn't of interest
to the megabuck corporations, so your filing isn't likely to be contested.
That cuts out the legal fees which can make competitive filings so expensive.

I want to wideband the tcx on my IC706 MK1. All the mods I have read
describe the row of diodes under "D108" as
DIODE/DIODE/SPACE/SPACE/DIODE
however, when I took the covers off it reads
SPACE/DIODE/DIODE/SPACE/DIODE.
Anyone else come accross this?
Which diode do I go for?
Definate answers only please (!) and please direct to my email.
Thanks in advance,

Martin - G4EFE - GQRP1176

Not such a bad idea, now that you mention it, Gary. I never really thought about it from that angle. There are plenty of other stations elsewhere in the Valley, though... a quick scan with a cheap radio with a telescoping whip indoors came up with 22 audible stations from 88 to 108 MHz, at least half "full quieting". I might still have a problem finding a good freq slot where higher power would be ok. Also, I assume that with a class A license, I would have to use type accepted commercial gear, etc. Frankly, I don't know enough about commercial broadcasting to know where to go for equipment, how to handle FCC inspections, what kinds of studies are necessary before applying, etc. That is out of my realm of experience. Maybe if I got a job at an operating station for a few months I would learn a lot about the day to day operation of a commercial broadcast station, but if I started asking too many questions about establishing a station, I might suddenly find a few doors slammed in my face.

Should LPFM be legalized, I imagine the red tape will be cut quite a bit. Even the quasi-legal status LPFM was starting to acquire was making it look interesting. The passing of RFB sort of rained on that parade. If I can't get into the game for under $5000 I just can't see myself doing it. This is more a service/hobby that ideally will pay for itself than a primary business.

If I understand you correctly, licensing is not particularly costly when nobody else is interested in your market. I certainly did not know that. Now, what would be my course of action... file application for a license, and then the FCC solicits comments from existing broadcasters and pending applicants? Can somebody else object even though there is no likelyhood of my interfering with their existing or proposed station on another freq? Does it simply turn into a bidding war for a freq? Can they object on grounds that I am digging into their market even though I am not interfering? If that is the case I would probably have problems, as most of the audible FM stations are here on the U.S. side.

If you can point me to any good references or FAQs that would tell me the basics, just so I would at least know what questions to ask you guys who DO have broadcast experience, I would be quite grateful. Also any experiences, anecdotes, info, etc on any aspects of licensing, station setup, technical requirements, practical considerations, etc.

Well I guess I better look for part 73 to download. Thanks Gary and anybody else who can help shed some light.

Wire it in parallel or you'll regret it!

In parallel: voltage stays the same, current increases.
In series: current stays the same, voltage increases.

you can use your old charger, it will just take longer to charge.

Dear Bob,

I have not built the TenTec QRP rigs, bu tI have worked quite a few (10 or 15, perhaps) on 30 meters.

Without exception, they have been rock steady signals, free of chirp or clicks.

I HAVE built TenTec's 20m to 6m transverter, however, and if the QRP kits are even half the quality of that kit, they are well-worth the money.

Hope this helps.

Not familiar with that exact tube. However I have worked with several
other TWTs. Be careful if you fire it up. Let it cook in with just
heater running for 48 hours. The tubes usually get left sitting for
years and the internal components give off various molecules. If you
fire them up with all of the operating voltages, it can cause
ionization. This causes the beam to defocus and increases the beam
current. The defocused beam causes more ionization and further
degeneration.
Some tubes can be recovered. You can also try refocussing the TWT with
small magnets. It works. TWTs are an extreme gamble when purchased at
hamfests. Thats were I have picked mine up from. I have had a 50% miss
ratio. I pay no more 20 dollars for complete power supply and system.
Most other stuff is useless. Even though they look in great shape.
Gud Luc. Ya gotta love a TWT.
Paul.

Where can I find some construction info for this rig? Sounds like a fun one to build.

>
>

Bought an ARK40 at Manassass ham fest a couple of weeks back. Impulse item; I don't do that often. I asked the person at the S&S table why the big ugly ARK cost more than the small, cute TAC-1. They rattled off the specs, and persuaded me to get the ARK-40.

Construction is pretty good. Circuit seems a bit over-designed perhaps. Two circuit boards, the denser one is only the freq synthesizer. All other tx and rx functions are on the other board.

One thing I don't like is the rats nest of wires connecting the boards and front/back pannel controls. Seems to me some of the controls could have been board-mounted. Not a problem once it's buttoned up, however.

Tuning via thumb-wheel switches is a bit odd, but I think I can get used to it.

Parts count was exact, no shortages, no extras. This actually helped me find a couple of components I put in wrong place.

Performance? I don't know yet. One step of the alignment could not be performed (getting the VCO control voltage to be 3.85V +- .05V !!). Finished alignment as best I could, and wound up with a semi-deaf RX with extremely harsh sounding audio.

S&S gaurantees that it will work for a $25 repair fee. I am about to punt and see how good their guarantee is since I won't have much free time before the 90 day warrentee runs out. I will let you know.

> the types above and any related designs?

The inverted vee would be the best bet on 20, and probably also on 40, depending on the height. The ELNEC demo program is able to analyze antennas like these, and it's free from http://www.teleport.com/~w7el. It'll give you a good idea of the characteristics of most antennas you could use. But it can't show the sometimes significant effects of all the conductors in an urban environment, so some experimentation is called for, too.

> is concerned ? Also I am estimating a cable length of about 50feet. Is
> this too long for 3W CW ? Should I restructure my shack to shorten the
> cable length ?

The power you're running makes no difference, except that you'll need every dB you can get to stay above the received station's noise level. The _ARRL Antenna Book_ shows the attenuation of various cable types. From the Antenna Book graph, 50 feet of RG213 has a loss of about 0.4 dB on 20 meters and less on 40. Any larger or lower-loss cable you use will have a loss of no more than a very small fraction of a dB less, so it's not worthwhile to use anything more expensive.

> 3. Do I need a 1:1 balun if i use a inverted V antenna with the above
> mentioned cables ? Can I just use a connector and hook up the cable
> directly ? I am asking this from the point of view of loss.

What the balun will do is prevent feedline radiation (and signal pickup). If your feedline runs close to house power wiring, telephone wiring, and the like, and if the feedline is a length that aggravates feedline current flow, a balun may reduce the loss. Otherwise it probably won't.

> 4. Is there a lot of activity in the 80 m band in CW QRP ? Is it worth
> considering designing a shortened 80 m antenna ?

I believe there's a fair amount of activity on 80 m CW QRP, but mostly in the more densely populated regions of the country. Here in Oregon it's a very tough band for QRP. The reason is that most major population centers are quite distant, and QRP has trouble competing with the high QRN levels on that band. Put this together with the poor characteristics of most back yard 80 meter antennas, and you can plan on doing an awful lot of calling with very few responses. I find 40 and 30 meters to be much more usable for QRP.

> 5. How do wave (antenna) traps work with 3W CW for multiband antennas
> (like inverted V) ? Has anyone used a wave trap for QRP successfully ?
> Where can I get details to build wave traps (I have never built wave
> traps so detailed instructions will help) ?

There's no difference between traps for QRP and for other powers. Even though you can make the traps physically smaller because you don't have to worry about voltages being as high, it's generally a good idea because it'll increase trap loss. I've used trapped antennas for QRP a number of times. But certain combinations with even fairly good traps can produce a dB or two of loss on one or another band. Consequently, I tend to avoid them. I've found them to be a reasonable compromise in some situations, though. You really should get a copy of the _ARRL Antenna Book_. It's a good source for information on building trap antennas and nearly any other antenna-related topic you're liable to encounter.

> 6. I have a radio shack portable communications RX. Has anyone used

> radio for QRP RX. Can I just build a simple crystal controlled fixed
> freq. QRP TX and use the radio shack RX ? Has anyone tried this setup
> ?

I personally feel that running QRP is enough of a challenge without also limiting myself to one frequency. But I think there are quite a few folks running crystal controlled rigs, and they're surely having lots of fun. Judging by the number of people who respond a bit off frequency, I'd think that using a separate tunable receiver would be a great help.

I have a partial Johnson KW Matchbox ... it is just the best parts ...
bottom and back
with major components (two huge variables, coil, bandswitch, open wire
ceramic standoff connectors, etc.)

The top and side cage is missing, as is the front panel ... those would
need to
fabricated. It is clean, though the insulator strips on the coil need to
be repaired.

I'd like to trade this towards one of several items I need:

1. IIX Swinging Gate
2. Dual-3-500Z 160-10m amp
3. Torque Arms for Rohn 25 (need 6, perhaps 9)
4. Thrust bearing for Rohn 25 (need 2, perhaps 3)
5. Mounting plate for T2X on Rohn 25.
6. RadioWorks T-4G Line Isolator (or equivalent, need two)
7. Mic & Boom for Kenwood TS-450S (will rewire plug as necessary)

Or will sell outright for $125. shipped conus. 73, DavidC AA1FA

At the risk of making a fool of myself posting after one of my "RF Heros" (Roy Lewallen), Here's another suggestion we just used for our QRP/CW Field Day. We put up a full-sized 40m loop and fed it with 300 ohm twin lead. Unlike a dipole which works on the fundamental freq and odd multiples, the loop works on all multiples. The 300 ohm feedline is really easy to tune and also has much less loss than coax (important for our little peanut whistle).

If you are limited to a small space, consider a triangular-shaped loop. That way you only need one support up fairly high and stake it off on the 2 bottom corners. I'm not sure how Roy's demo program handles the acute angles, the older ones didn't like them... If you want to model the acute angles, make one angle into several segments made up of short pieces with several angles of more than 90 degrees.

With the loop you get multi-band coverage with no traps. You don't have the power to spare, and even good traps have a little bit of loss.

Man, I better quit before I stick my foot too far in my mouth - especially with Roy and Zack watching!

Hope you try the loop, have fun!

My first question is what will your translator output do for all of
the repeaters on 145.11, 145.13, 145.15, 145.17, 145.19 and
possibly 145.21? I suppose a translator could have uses, but
it sounds more like a project to jam than something that hams
would want on 2 meters if said hams use repeaters.

I just finished the 40 meter cw kit. Great radio. It was a joy to use. I say "was" becuase I accidently fried it a week after getting it done. My own fault...The only change I'd make: add a keyer such as the the Tick and add a decent speaker output and speaker. The tiny little thing they give you is oklay in a lpinch but I find myslef either using headphones of alligator clipping a better speaker on.

I built a slug-tuned input for an amp using 3 x 4-400's
and all I can say is that it's an empirical process, i.e.
good ole cut & try. A few mandatory tools are needed
such as an SWR analyzer (Autek RF-1 here) or noise
bridge. A supply of good ceramic slug-tuned coil forms,
a bunch of 500-1000 volt silver mica caps, and a
half-dozen small relays are all you need to homebrew
a tuned input. A quick glance in the handbook can be
helpful, too (RTFM)...

RE: 813 Filament voltage

Thoriated Tungsten filament tubes like these
need 'enough voltage and current to produce the
electrons for the peak plate current you run'.

New tubes often need less than the 'nominal'
filament voltage for adequate output. Higher
voltage than this just wastes filament like.

BUT if your filament voltage REGULATION is not
good you need a higher voltage to assure
'enough' even when the voltage drops.

I was able to more than double the service life
of 833's and 4-400A's and 4CX5000's in broadcast
service by carefully controlling the filament
voltage. I used Sola type constant-voltage
regulators driving a Powerstat type autotransformer
or a (large!) rheostat. About once a month I
dropped the filament voltage on RF tubes until
the output started to drop, then took it just up to
the point where there were 'excess electrons'. For
AM transmitters I monitored the audio distortion
on a test tone, and set both RF and AF tubes to
where distortion stopped decreasing.

All this is to say: it's best to be able to ADJUST
the filament voltage about +- 10 percent from
nominal.
